A

Scope

This project entails a preliminary assessment of the systems integration marketplace. Specifically, the issue is the extent to which any regulatory restrictions that have been or may be placed on Bell Atlantic with respect to the provision of inter-LATA services prohibits the company from portions of the systems integration marketplace.

This study is restricted in that INPUT analyzed only major information systems projects. The first cut at the definition of "major" was up to the interviewees. That is, INPUT asked them to identify major development efforts that they had completed in the last year, planned within the next year, or have currently under way. INPUT then qualified these jobs with respect to such issues as dollar size, the extent to which the project was being completed by external contractors, and the extent to which the project involved a data processing component. Only those jobs that were of a data processing orientation were included in this study.

The study is further restricted in that the projects that were pursued for the study came from leads that were known to INPUT at the outset of the study. All of these leads were within the United States commercial industrial sectors. For the purposes of this study, commercial includes state and local governments.

Although all projects that could legitimately be classified as a systems integration project were included, care was taken to classify these projects with respect to their communication requirements. We first classified projects in terms of whether there was a network requirement for those jobs with a wide network requirement. We then further classified those jobs as to whether the network was inter- or intra-LATA. Finally, for inter-networks, we assessed whether the network was in place or whether the development of the network was a component of the total project.

EXHIBIT 1

SCOPE

- "Major" Information Systems Projects
- INPUT List of Potential SI Initiatives
- U.S. Commercial Industry Sectors
- Communications Requirements Categories
 - Network/No Network
 - Inter-LATA/Non-Inter-LATA
 - Network Component/Network In Place

B

Methodology

A questionnaire targeting questions of interest to Bell Atlantic was prepared and reviewed by Bell Atlantic. Changes requested by Bell Atlantic were made.

Concurrently INPUT accumulated all known information on potential projects. By telephone INPUT attempted to identify knowledgeable representatives with respect to the individual projects. When a knowledgeable representative had been identified, an interview was conducted. At this point, no attempt was made to qualify the project with respect to being a systems integration job or having a communications requirement. That process occurred after all of the interview data was collected on each project. The data was tabulated with respect to the communications requirement and analyzed. Then a forecast was prepared and a final report generated.

EXHIBIT 2

METHODOLOGY

- Prepare Questionnaire and Revise per Bell Atlantic Request
- Accumulate Known Information on Potential Projects
- Interview, via Telephone, Company Representative
- Categorize Projects vis-a-vis Communications Requirements
- Tabulate Data
- Analyze Data
- Prepare Forecast by Communications Category
- Prepare Report

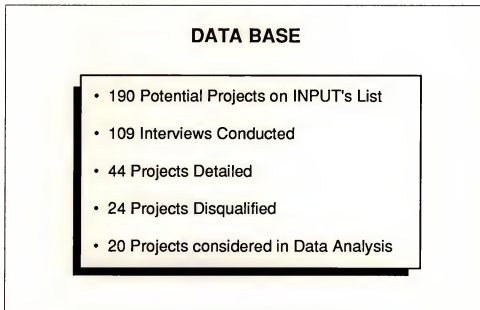

C

Data Base

A total of 190 projects formed the basis of INPUT's preliminary list of contacts. At the conclusion of this study, 109 interviews had been conducted. Of these interviews, 44 projects were detailed. Twenty-four of these 44 were disqualified. The disqualifications were primarily the result of INPUT's judgment that the project was being completed in-house, was of a transport only nature, or was not a project meeting INPUT's definition of systems integration. Twenty projects fell through these screens and are included in this study.

EXHIBIT 3

D

Major Projects Included in Data Base

INPUT believes that the projects included form a representative sample of typical projects within the systems integration marketplace. As may be seen in Exhibits 4a and 4b, the project expenditures range from a low of one-half million dollars to a high of two hundred million dollars.

Several industries are represented in the list, and numerous systems integration vendors are present.

EXHIBIT 4a

E**Communications
Requirement
Categories**

All communications categories defined at the outset of the study are included within the 20 projects. It is to be noted that 75% of these projects included a network and that, for those network projects, 80% were inter-LATA. However, in Bell Atlantic's interest, the data indicates that some 75% of these inter-LATA networks are already in place.

It would appear then, that although a network is generally required and that the network is generally of an inter-LATA nature, much of this work has previously been completed. It seems reasonable to assume that any decision regarding a long-distance carrier was previously made and that this requirement for an SI vendor would no longer be an issue.

In approximately 75% of these in-place networks, there is the possibility that the integrator would have to interface to the existing network, as shown in Exhibit 5.

EXHIBIT 5**COMMUNICATIONS REQUIREMENT CATEGORIES**

* Note: Transport area is not known on one project.

F**Target Applications
by Communications
Category**

Exhibits 6a and 6b detail, first, the network requirements by the project; second, the inter-LATA requirements for these projects; and third, for those networks that are inter-LATA, the current status of the development of that network.

EXHIBIT 6a

TARGET APPLICATIONS BY COMMUNICATIONS CATEGORY

Target Application	Network		Inter-LATA		Inter-LATA Network Status To Be Developed	
	No #	Yes #	Yes #	No #	In Place #	Developed #
Electronic Tandem Network		1		1

Regionalize MIS Function		1	1			1
Billing System	1					
Accounting Support		1	DK			
Student Information	1					
Lease Management Data Base		1	1		1	

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry, no matter how small, should be recorded to ensure the integrity of the financial statements. This includes not only sales and purchases but also expenses and income. The document also highlights the need for regular reconciliation of bank statements and the company's records to identify any discrepancies early on.

Furthermore, it outlines the various methods used for recording transactions, such as the double-entry system, which ensures that the accounting equation remains balanced. The document provides detailed instructions on how to classify transactions into different accounts, such as assets, liabilities, and equity, and how to calculate the ending balances for each account.

In addition, the document discusses the importance of using appropriate accounting principles and standards to ensure that the financial statements are prepared consistently and fairly. It also touches upon the role of internal controls in preventing errors and fraud, and the importance of maintaining proper documentation for all transactions.

The second part of the document provides a step-by-step guide to preparing the financial statements. It starts with the trial balance, which is used to verify that the debits equal the credits. From there, it shows how to calculate the net income or loss, and how to determine the ending balances for the assets, liabilities, and equity accounts. The document also provides examples of how to prepare the income statement, balance sheet, and statement of cash flows.

Finally, the document concludes by emphasizing the importance of reviewing the financial statements carefully to ensure that they are accurate and complete. It also notes that the financial statements are a key tool for management to make informed decisions about the company's operations and financial health.

EXHIBIT 6b

TARGET APPLICATIONS BY COMMUNICATIONS CATEGORY

Laboratory Information System		1	1		1	

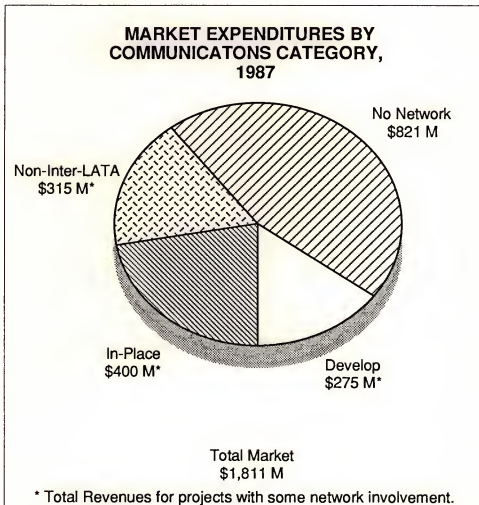

G

Market Expenditures by Communications Category

INPUT estimates that approximately 55% of the expenditures for systems integration projects involve a network requirement. INPUT further estimates that for those projects requiring a network, some 68% of the expenditures for systems integration projects have an associated inter-LATA requirement. Although these projects have an inter-LATA requirement, as noted earlier, much of this work has been completed and the associated long-distance carrier decision has been made.

On the assumption that the long-distance carrier decision for networks that are in place has been made, INPUT estimates that jobs that require such a decision involve only those projects for which that decision has yet to be made. Accordingly, INPUT estimates that the avoidance of any inter-LATA restrictions on the part of Bell Atlantic would extract just \$275 million from this total 1987 market of \$1.8 billion. This calculation represents just 15% of the total market that may need to be avoided by Bell Atlantic. Details are in Exhibit 7.

EXHIBIT 7

H

Communications Requirements

Exhibits 8a and 8b detail the hardware and/or services requirements relating to communications for the projects included in this study. Eleven of these projects include one or both requirements. Again, the indication is that there are significant opportunities for Bell Atlantic to market their communications expertise in the systems integration marketplace.

EXHIBIT 8a

COMMUNICATIONS REQUIREMENTS

I**Long-Distance Carrier
Selection Decision
Makers**

Eight of the twenty projects included in this study involve a long-distance carrier decision to be completed sometime during the course of the project. In only two instances was the decision maker outside of the traditional data processing environment. This suggests that Bell Atlantic's traditional clients will continue to have a data processing orientation even within the systems integration marketplace.

Respondents, in all instances, identified the decision maker as the key influencer of this carrier decision. It may have been the case that respondents were simply pointing out the key influencer of the decision without identifying other participants in that decision. (Exhibit 9.)

EXHIBIT 9

J

Preference for Class of
Vendors

Interviewees were provided with a list of classes of vendors as follows: computer hardware manufacturers, software services suppliers, communications hardware suppliers, communications services suppliers, carrier providers, and regional Bell operating companies (RBOCs). Given this list, they were asked to state which type of vendor they would prefer to complete a project similar to the one discussed.

Over 50% of the respondents indicated a preference for software services suppliers even though, as noted earlier, many of the projects included a network component. Both computer hardware and communications hardware companies, by frequency at least, were a distant second. This tier was followed by a third tier of communications services providers including communications consultants, carriers, and the regional Bell companies.

The significant point to be understood from the results of this question is that buyers prefer software services companies who they perceive as able to handle the multifaceted aspects of a systems integration job as opposed to those vendors who are most noted for providing one or more components of that job.

The relatively poor showing of the RBOCs on this list suggests that Bell Atlantic, as a member of this class, is not recognized by buyers as being a preferred vendor for systems integration projects. For Bell Atlantic this further suggests that the company would have to work to establish itself as a recognized supplier of systems integration services. (Exhibits 10a and 10b.)

K

**Long-Distance
Carrier Contract
Signer**

It is of little surprise that in all instances the signer of the contract is the ultimate buyer, that is, the corporation sponsoring the systems integration project. In no instance was the vendor the signer acting on behalf of the buyer.

The indication in this question, and in several previous questions, is that the long-distance carrier decision has been and will continue to be within the province of the buyer organization. They make the decision, and they sign the contract. Vendors do not get directly involved in this process.

An open issue, however, is the extent to which the design of a network, as part of a systems integration project, influences that carrier decision. Data on that aspect of this overall issue was not a part of this particular assignment. (Exhibit 11).

EXHIBIT 11

LONG-DISTANCE CARRIER CONTRACT SIGNER	
Frequency of Response	
Buyer	100%
Vendor	0%

L

Class of Vendor Preference by Communications Requirement

As indicated earlier, there is an overwhelming preference for software and services companies regardless of the network requirement for systems integration jobs. No clear vendor preference pattern is indicated in the data with respect to the use of communications-oriented vendors, given the network requirements of particular jobs.

It is interesting to note that software and services firms were not indicated as a preference for any job that involved a network. Preference in these cases went to communications-oriented suppliers, or, in two instances, a computer hardware supplier.

The indication is that buyers do make an association between network requirements and the capabilities of communications-oriented suppliers. This may bode well for Bell Atlantic as it explores the systems integration marketplace in that it provides the company with an image platform from which to launch its business. Bell Atlantic should not be satisfied, however, with focusing strictly on the network portion of the marketplace because a significant portion of the systems integration marketplace does not include a network requirement. (Exhibit 12.)

EXHIBIT 12

M

Open Comments on Restrictions

As a final item, the issues surrounding the inter-LATA restrictions were briefly explained to the respondents. After this explanation was provided, respondents were asked for comments regarding the impact that these restrictions might have on their selection of a systems integration vendor to develop a project such as the one discussed. (It should be noted that this question was revised at the request of Bell Atlantic after several of the interviews had been completed.)

In those instances in which the network is the project and that network is inter-LATA, the buyer appears to be concerned about this restriction. For the remainder of the jobs, the buyer concern is not so much about the restriction as it is about the qualifications of the vendor.

Considering the low preference levels for RBOCs in general, it would appear again that a significant sales and marketing effort will be required on the part of Bell Atlantic to convince buyers of its capabilities. It is not the restriction as much as it is the perception of RBOCs in general that the buyer will respond to.

Open Comments On Restrictions

Expects vendor to be able to handle all phases of project, except what he keeps for himself.

"In a great way." It prevented WI Bell (BOC) from competing directly. BOC can't specify inter-LATA suppliers.

In their proposal, C&P gave scenarios for network based on each of the common carriers. Client made the interface selection based on the scenarios.

Would not concern us; we are now our own carrier.

Didn't think they (the RBOC) would be interested in this type of work.

We base our decision on qualifications.

Would not use an RBOC for a telecommunications network; the restrictions on the RBOC would be an issue.

It wouldn't—we only use microwave.

Since there is no long-distance involved, the restriction wouldn't matter to us.

Restriction would not, in and of itself, impact the selection. The RBOC would have to be in this type of business; even then, we'd look at our own network requirements and decide.

Would not impact, if they proved to be best for job.

Doubt if we would be inclined to use an RBOC to develop any project.

Most of the other respondents, including those we discarded from further SI analysis, had no reservations regarding vendor selection vis-a-vis this issue. Their reservations dealt with overall capabilities of the RBOCs.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry, no matter how small, should be recorded to ensure the integrity of the financial data. This includes not only sales and purchases but also expenses and income. The document provides a detailed list of items that should be tracked, such as inventory levels, supplier payments, and customer orders. It also outlines the procedures for reconciling accounts and resolving any discrepancies that may arise.

The second part of the document focuses on the role of management in overseeing the financial operations. It stresses the need for regular communication between the management team and the accounting department. This involves reviewing financial statements, budgets, and forecasts to ensure that the organization is on track to meet its financial goals. The document also discusses the importance of identifying potential risks and taking proactive measures to mitigate them. This includes monitoring market conditions, assessing the creditworthiness of suppliers and customers, and implementing internal controls to prevent fraud and errors.

The final part of the document provides a summary of the key points discussed and offers some practical advice for implementing the recommendations. It encourages the reader to take a systematic approach to financial management and to seek professional advice when needed. The document concludes by expressing confidence that the reader will be able to successfully manage the financial aspects of their organization and achieve long-term success.

PROJECT PROFILEPROJECT: ETNINDUSTRY: State/Local Gov'tPRIME CONTRACTOR: C&PDEVELOPMENT VALUE: \$4 millionTIME REQUIRED: 3 months**BUSINESS PROBLEM/PROJECT OBJECTIVES:**

- Reduce overall long-distance cost (i.e., a savings value over time).
- Reduce costs on charge backs to state offices & agencies for use of long-distance (voice) services.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Expand existing Centrex hub by the addition of another Centrex hub in Clarksburg, West Virginia.
- Installation of 7 Centrex nodes throughout West Virginia to interface with the 2 Centrex hubs via star-type design.

PROJECT PROFILE

PROJECT: Accounting Support

INDUSTRY: Insurance

PRIME CONTRACTOR: Arthur Andersen

DEVELOPMENT VALUE: UNK

TIME REQUIRED: 42 months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Need to integrate accounting and insurance functions at headquarters and local offices.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Design system.
- Select hardware.
- Develop software.
- Manage facility.

PROJECT PROFILE

PROJECT: Student Information System

INDUSTRY: Education

PRIME CONTRACTOR: Coopers & Lybrand

DEVELOPMENT VALUE: \$10 million

TIME REQUIRED: 36 months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Replace "homegrown" financial aid system and proprietary student information system with modified software products based on Cullinet's IDMS/R.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Procure software package.
- Modify and implement packages.
- Consult on hardware selection.

PROJECT PROFILE

PROJECT: Lease Management Data Base

INDUSTRY: Process Mfg.

PRIME CONTRACTOR: Big 8 Accounting Firm

DEVELOPMENT VALUE: \$20 million+

TIME REQUIRED: 36+ months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Company recognized a need to have a data base that will accommodate and manage lease information, accounting changes, and be more technologically up-to-date than existing systems.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Procure lease management and related packages and make modifications to integrate them into a system and suit them to client's particular needs.
- Install and train client employees on system.

<u>COMPONENT</u>	<u>DESCRIPTION(#)</u>	<u>FORMAT</u>	<u>SOURCE</u>	<u>EXP.</u>

** Project is divided between AY and client personnel. It is too new to have definite ideas of expenses.

PROJECT PROFILE

PROJECT: Office Automation

INDUSTRY: Services

PRIME CONTRACTOR: Systemhouse

DEVELOPMENT VALUE: \$1.2 million

TIME REQUIRED: 17 months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Aircraft Owners & Pilots Association (AOPA) represents the interests of general aviation, pilots, and aircraft owners through such services as publications, newsletters, annual meetings, etc. Most of the services and administrative tasks are still manual, slowing down productivity.
- Need to further and better automate existing business, including a distributed data base that is maintainable by the accounting staff.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Install a LAN.
- Modify Salomon-3 Accounting System to function as a data base to be run on IBM 4361.
- Procurement of PCs where none existed.
- Complete system support and training.

<u>COMPONENT</u>	<u>DESCRIPTION(#)</u>	<u>FORMAT</u>	<u>SOURCE</u>	<u>EXP.</u>

PROJECT PROFILE

PROJECT: Data Comm. Network

INDUSTRY: State/Local Gov't

PRIME CONTRACTOR: Boeing Computer Services

DEVELOPMENT VALUE: \$23 million

TIME REQUIRED: 72 Months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Enable several individual state-wide agency networks to effectively communicate with each other for the sharing of data.
- Provide state information workers with a single, statewide network for accessing the Commonwealth's information data bases.
- Design such a network while reducing cost of data transmission.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Create a Network Control Center to serve as focal point for statewide network.
- Organize an Integrated Control System (ICS) designed to provide an agencywide data base for storing administrative records (eg, accounting, purchasing, personnel, payroll).
- Redesign network and communications circuits to increase transmission speeds in order to cut down on data transmission costs, while supporting some 3,200 terminals, printers, and other addressable devices operating under IBM SDLC and BSC and Sperry Uniscope protocols.
- Procure protocol converters to help improve response time and increase user productivity.
- Provide on-site maintenance per annual renewable contract.

<u>COMPONENT</u>	<u>DESCRIPTION(#)</u>	<u>FORMAT</u>	<u>SOURCE</u>	<u>EXP.</u>

PROJECT PROFILE

PROJECT: Auto Crew Calling

INDUSTRY: Transportation

PRIME CONTRACTOR: Company in joint venture with PST (of Denver, CO)

DEVELOPMENT VALUE: \$0.5 million

TIME REQUIRED: 24 months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Railroad was struggling with a decentralized, manual crew-calling system (a system for scheduling and assigning crew members to particular freight trains for particular runs).
- The manual, decentralized system was laden with problems including errors in scheduling employees, failing to call employees who were supposed to be assigned (but who still collected for the work they didn't do, via claims filed for not being contacted).
- Excess overhead (e.g., railroad clerks).
- Required an automated centralized crew-calling system that would incorporate the different labor rules for the various railroads in addition to performing the basic scheduling and assigning functions.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Customize and modify existing centralized, automated crew-calling system from PST, to later be marketed as a turnkey system by PST.
- Installation of 12 terminals at central HQ in Chicago into existing IBM 3083.
- Automated system eventually to be linked to payroll.

<u>COMPONENT</u>	<u>DESCRIPTION(#)</u>	<u>FORMAT</u>	<u>SOURCE</u>	<u>EXP.</u>

PROJECT PROFILE

PROJECT: Data Center Consolidation

INDUSTRY: Manufacturing

PRIME CONTRACTOR: Computer Task Group

DEVELOPMENT VALUE: \$25 million

TIME REQUIRED: 24 months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- A partnership was set up between two steel companies to consolidate their sales efforts and data center operations.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Migrate all of the programs from the current centers to the new central location.
- Redesign all of the unique and unsupported programs using TRANSFORM and CORTEX (standard program generator systems) that have been in operation at the data centers.
- Redesign the production control system.
- Provide facilities management services.

PROJECT PROFILE

PROJECT: DBMS Installation

INDUSTRY: Process Mfg.

PRIME CONTRACTOR: Arthur Andersen

DEVELOPMENT VALUE: \$10 million

TIME REQUIRED: 48 months

BUSINESS PROBLEM/PROJECT OBJECTIVES:

- Company has outgrown its existing data base and is seeking a new, more powerful data base that will enable the company to make better management decisions.
- In addition, management decisions must incorporate up-to-date information on capacity planning, contract materials planning, and scheduling.

SERVICES TO BE PROVIDED/TECHNOLOGIES EMPLOYED:

- Install and modify Arthur Andersen's MAC-PAC software.
- Provide consulting, analytical and programming staff.

<u>COMPONENT</u>	<u>DESCRIPTION(#)</u>	<u>FORMAT</u>	<u>SOURCE</u>	<u>EXP.</u>
