U-EMI-I

I INTRODUCTION

A. PURPOSE

- o This report is part of INPUT's End User Planning Program. It identifies the future information systems environment with emphasis on the role of the information center. It provides a realistic view of how the information systems function will evolve over the coming decade.
- o The report answers the following questions:
 - What responsibilities are typically assigned to the information center?
Why?
 - What impact has the flurry of microcomputer activity had on the information center?
 - What are the biggest challenges facing the information center?
 - How will systems development be approached in 1995?
 - What is likely to happen to the functions known as the information center and end-user computing support?

B. SCOPE

- o This report will focus on the analysis of the information system events that are likely to take place during the forthcoming decade. It will examine the organizational ramifications of integrating end-user computing, office automation and data processing. Emphasis will be placed on the evolution of the information center. This report does not address the technical issues associated with the information center nor does it identify specific product features. Instead, it deals primarily with tactical and strategic issues surrounding end-user computing and associated functions.

- o The following people should find this report pertinent:
 - IS senior management.

 - Information center management.

 - Manager of systems development.

 - End-user managers.

 - Senior corporate managers.

C. RELATED INPUT REPORTS

- o Update on the Information Center.
 - This report examines and analyzes current product offerings, significant developments, emerging technologies, and important issues and trends.

- o Information Systems Implications of IBM Software Strategies.
 - This report provides an indepth analysis of IBM software directions for the next 20 years.

- o Training: Prerequisite to End-User Computing.
 - This report identifies the issues emerging from the ever growing end-user training requirements and recommends specific planning steps.

- o The Resurrection of Distributed Data Processing.
 - This report forecasts the role of DDP in the corporate computing strategy and examines the impact of LANs and micro-mainframe links on the DDP concept.

- o The Changing Dynamics of IS Organizations, (mid-1985).
 - This report will forecast IS organizations' trends and recommend strategies that will improve IS responsiveness to the corporations' competitive needs.

- o Micro-Mainframe: Corporate Impact, (mid-1985).
 - This report will examine the organizational and technological effects of microcomputers in the corporation.

II

II EXECUTIVE SUMMARY

- o The executive summary is designed in presentation format in order to:
 - Help the busy reader quickly review key research findings.
 - Provide an executive presentation, complete with script and exhibits, to facilitate group communication.
- o The key points of this entire report are summarized in Exhibits II-1 through II-5. On the left-hand page facing each exhibit is a script explaining the exhibit's contents.

A. THE CENTER WILL DISAPPEAR

- o The information center was devised by IBM in the mid-1970s to give the users the ability to help themselves solve some of their own information systems problems. The idea of a walk-in center, where users could learn to write programs in fourth generation languages, didn't become widely accepted until the early 1980s. Some organizations are just now in the process of installing their first information centers.
- o These walk-in centers have ^{played} and are still playing an important role in the evolution of end-user computing. They have demonstrated the capabilities of the computer to the users and have introduced decision support systems.
- o The center, however, is phasing out. ^{It is} They are giving way to a more powerful and convenient device—the microcomputer. With the microcomputer, the end users can remain at their own workstations and either emulate an information center, 3270 terminal, or perform decision-making functions on their standalone microcomputers.
- o With more sophisticated micro-mainframe links and the installation of processors at the departmental level to support end-user computing and office automation, there will be less need for the information center. Even centralized training will be replaced by improved computer-based training.

Dear Sir,
I have the honor to acknowledge the receipt of your letter of the 15th inst. in relation to the above matter.

The same has been referred to the proper authorities for their consideration and they will advise you as soon as a decision has been reached.

I am, Sir, very respectfully,
Yours truly,
[Signature]

[Faint text, possibly a signature or address block]

[Faint text, possibly a signature or address block]

B. THE RESPONSIBILITIES OF THE INFORMATION CENTER ARE
CURRENTLY GROWING

- o Information Systems (IS) management did not anticipate the overwhelming success of products marketed to support end-user computing. Very little planning in the area has taken place, primarily because the impetus has come from IS, but rather from the vendors and the end users themselves. ^{not}
- o IS management has viewed microcomputers and office automation products as issues to deal with and have, therefore, handed them over to the information center. In the mind of IS management, there has been a differentiation between end-user computing and traditional data processing systems.
- o IS management must realize that the information center is becoming a full-fledged information systems department with the capabilities of developing comprehensive information systems and the ability to compete with the systems development staff in providing service to the end users.

THE UNIVERSITY OF CHICAGO
DEPARTMENT OF CHEMISTRY

RESEARCH REPORT
No. 1000

BY
J. H. GOLDSTEIN

AND
M. L. HUGGINS

RECEIVED
MAY 15 1954

CHICAGO, ILLINOIS

1954

C. THE NEED FOR TRAINING AND CONSULTING WILL CONTINUE TO GROW

- o The total installed base of microcomputers in all businesses with revenues greater than \$10 million is approximately four million units. This figure will *more than* nearly double by 1989.
- o In 1984 90% of the installed base of microcomputers were standalone units, but by 1990 INPUT predicts that the percentage of standard microcomputer will drop to only 30%. The remaining 70% will be sharing resources through *local area networks* (LANs), multiuser systems, and micro-mainframe links.
- o Not only will there be millions of new end users to train during the next five years, but the progressive integration of functions will produce more complex systems and comprehensive software. *The* users will be unable to develop these new capabilities without assistance from IS consultants.
- o This projected shift from a centralized control of information systems *resources* increases to dispersed networks of microcomputers, sharing data and processing capabilities with other computers, adds credence to the predicted demise of the information center.

...

...

...

...

D. INTEGRATION IS INEVITABLE

- o IBM's strategy has been characterized by continued centralization of control through SNA/VM/MVS central host systems. The information center concept fits into this strategy. INPUT believes this centralization of control will continue through the 1980s.
- o During the past five years there has been a tremendous growth in the installation of standalone microcomputers and office automation systems. Some of the office automation systems are supported by independent processors installed in various locations within an organization. To this point, end-user computing, office automation, and data processing have been headed down their separate paths.
- o IS organizations and IBM (as well as other hardware/software/communications vendors) recognize the need to integrate these three separate information systems services to facilitate the sharing of information and resources. INPUT believes this integration will be emphasized during the time between 1990 and 1995 and INPUT identifies this as the Electronic Office period.

1. The first part of the document discusses the importance of maintaining accurate records and the role of the auditor in this process.

2. The second part of the document describes the various methods used to collect and analyze data, including interviews, surveys, and document analysis.

3. The third part of the document discusses the results of the study and the implications for practice and policy.

E. SEPARATE FUNCTIONS WILL EMERGE

- o Presently, the data processing systems development function has little involvement with the activities of the information center or office automation functions. Each function has its specialists who work with users to solve specific information system problems.
- o INPUT sees evidence that these functions have started to merge. Meetings are taking place between the staffs of these functions to share ideas and formulate mutual plans. The information center representatives are being requested to attend data processing systems projects meetings to identify the information needs of the end users.
- o INPUT believes that future systems will be designed to accommodate the information needs of corporate, regional, divisional, departmental and the individual contributors.
- o Once the total merger takes place during the Electronic Office period, end-user computing and office automation will become subunits within the IS systems development function. This will be the end of the information center era.

1. The first paragraph of the report states that the subject is a member of the Communist Party, USA, and is active in the [redacted] area.

2. The second paragraph of the report states that the subject is a member of the [redacted] and is active in the [redacted] area.

3. The third paragraph of the report states that the subject is a member of the [redacted] and is active in the [redacted] area.

4. The fourth paragraph of the report states that the subject is a member of the [redacted] and is active in the [redacted] area.

F. PREPARE FOR THE INTEGRATED ELECTRONIC OFFICE PERIOD

- o Training and education requirements will more than double during the next four years due to the increased number of end users and the complexity of the software products. IS should continue to evaluate training methodologies and develop training plans that parallel the anticipated end-user computing evolution. Business consulting skill should continue to be recruited and developed.
- o The collaboration between the information center staff and the traditional systems development staff should be promoted by developing organizational plans that align the two functions under the same manager.
- o An indepth evaluation of available micro-mainframe links should be conducted to identify and acquire those links that are compatible with the existing mainframe data base environment and microcomputer software.
- o The central host mainframe will be unable to handle the increased load generated by the Electronic Office period. If not already underway, small mainframes, supermicro, or minicomputer systems should be evaluated for installation at the departmental level to handle local office automation and end-user computing requirements.
- o Before making a total commitment to a product or concept, thoroughly test it in a controlled situation. The Electronic Office period will bring about major changes in how organizations handle their information systems needs. A well thought plan mapping the evolutionary steps will be essential to the success of the Electronic Office period. *thought-out*

III

III THE INFORMATION CENTER'S EXPANDING RESPONSIBILITIES

A. THE ORIGINAL CHARTER

- o The origin of the information center concept dates back to the announcement of IBM's Report Program Generator (RPG), circa 1960. The backlog of requests for data processing services has been a problem from the start of computers in business. The idea of RPG was to provide the users with a simple-to-use, parameter-driven language by which they could produce ad hoc reports. The information systems (IS) departments would designate programmers to assist the users in the use of RPG.
- o As the teleprocessing equipment became a standard interface between IS and the users, and interactive systems software became available to facilitate timesharing, some users began developing on-line programs in languages such as APL and FORTRAN, under TSO. This type of users were normally found in the engineering departments or in research and development.
- o The first actual information centers were set up in rooms located near the data center and equipped with several IBM 3270 display terminals and remote printers. The information center's staff assisted the end users in obtaining access to specific mainframe-maintained data through query facilities and then assisted them in the use of analysis and reporting software tools.

CONFIDENTIAL - SECURITY INFORMATION

CONFIDENTIAL - SECURITY INFORMATION

CONFIDENTIAL - SECURITY INFORMATION

CONFIDENTIAL - SECURITY INFORMATION

CONFIDENTIAL - SECURITY INFORMATION

CONFIDENTIAL - SECURITY INFORMATION

- o Generally, the initiation of the information center concept has been approached with caution. VM/CMS or TSO and the associated information center systems, ^{software} has normally been installed on existing production mainframes. Pilot end-user business units have been selected to evaluate the concept before making a total commitment. Typically, the information center staff would start with one or two people from the systems development function.

- o INPUT believes that ^g the IS management was surprised by the overwhelming success of the information center. In a 1983 survey, INPUT asked IS managers to predict who would be the most active users of the information center by 1985. In Exhibit III-1 the results of the 1983 survey are on the left and indicate that IS managers thought ^g that the clerical staff would be the big users, followed by the professional programming staff. This prediction could have been based on the RPG experience, where the programmers helped department clerks produce reports as requested from line supervisors and managers. ✓
III - 1

- o The information on the right side of Exhibit III-1 shows the type of users ^o that are actually active users of the information center in 1985. The two most active users are middle management and the supporting staff, which includes ^F ^o professionals such as financial analysts and business planners. The reason for the shift is the emphasis on the decision making support capabilities of the information center and the fact that microcomputer usage is now under the control of the information center.

B. THE PERSONAL COMPUTER CATALYST

- o The acceptance of the personal computer by middle management as a decision support tool has added a new dimension to the responsibilities of the information center, which now includes: ^g

Faint, illegible text at the top of the page, possibly a header or introductory paragraph.

Fourth block of faint, illegible text in the lower section.

Fifth block of faint, illegible text at the bottom of the page.

- Microcomputer compatibility standards.
 - Microcomputer software selection.
 - Micro-mainframe linkage.
 - Microcomputer software training for end users.
 - Microcomputer users' group coordination.
 - Microcomputer equipment selection.
- o The IS community, in general, did not realize how significant the advent of the microcomputer would impact its role. The IS managers knew that the uncontrolled proliferation of microcomputers was something to grapple with, but they didn't view this new information tool as an opportunity to improve the overall information system services.
- o The information center has been given the responsibility of controlling and administering the use of microcomputers, primarily because the end users are performing similar functions on the microcomputers as has been performed in the original information centers; data manipulation, analysis, reporting and graphics.
- o Will the microcomputer eliminate the need for an information center? The answer is yes and no. With standalone micros, remote video display terminals, and micro-to-mainframe links the concept of the "center" will disappear. The knowledge workers and information handlers aren't required to come to a center to build computer-based business models and perform "what if" analyses. They can perform these decision support functions at their individual workstations.

THE UNIVERSITY OF CHICAGO PRESS

530 NORTH DEARBORN STREET, CHICAGO 12, ILLINOIS

U.S. GOVERNMENT PRINTING OFFICE: 1954

THE UNIVERSITY OF CHICAGO PRESS

530 NORTH DEARBORN STREET, CHICAGO 12, ILLINOIS

U.S. GOVERNMENT PRINTING OFFICE: 1954

- o The part of the information center that will not disappear, and instead will grow considerably over the next few years, is the end-user computing support staff. More and more microcomputers are being installed in businesses, as shown in Exhibit III-2. The installed base of four million microcomputers in 1985 will more than double over the next four years. This means that literally millions of workers will have to be educated on how to apply these new tools and associated and trained on the assisted software products.
- o Micros are working their way into every aspect of the services performed by the information systems functions. INPUT is predicting that within the next decade micros will be an integrated part of most every information system project. This will force the collaboration between the end-user support staff (information center) and the systems development staff.
- o The end-user computing support staff will continue to grow until such time that production systems are designed with the personal computing needs of the end users taken into consideration. Once the systems development staff exploits the functionality of the microcomputer, the "information center" will do less applications work and more training and consulting (evaluating the alternatives rather than implementing a solution).

C. OFFICE AUTOMATION POPULARITY

- o Automating the day-to-day functions of the office workers has been an issue facing IS for more than a decade. The big problem in selling office automation to senior management has been the inability to accurately measure the intangible benefits of the electronic mail, electronic filing and administrative support features.
- o Most electronic office systems have started with word processing products because the typing function produces a tangible product. Productivity

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for the integrity of the financial system and for the ability to detect and prevent fraud. The text also notes that clear and concise reporting is necessary for effective communication between different levels of management.

2. The second part of the document focuses on the role of internal controls in ensuring the reliability of financial information. It describes how a well-designed system of internal controls can help to minimize the risk of errors and misstatements. The text also discusses the importance of regular monitoring and evaluation of these controls to ensure they remain effective over time.

3. The third part of the document addresses the need for transparency and accountability in financial reporting. It highlights the importance of providing timely and accurate information to stakeholders, including investors, creditors, and the public. The text also discusses the role of external audits in providing an independent assessment of the financial statements and the overall financial health of the organization.

CONCLUSION

In conclusion, the document emphasizes that a strong financial reporting system is essential for the success of any organization. It stresses the importance of maintaining accurate records, implementing effective internal controls, and providing transparent and accountable financial information. The text also notes that regular monitoring and evaluation of these systems are necessary to ensure they remain effective and up-to-date.

The document concludes by stating that a commitment to high standards of financial reporting is essential for building trust and confidence among stakeholders. It encourages organizations to continue to improve their financial reporting practices and to seek out opportunities for innovation and improvement.

improvements could therefore be identified and office system equipment could be cost justified.

- o In the beginning of the word processing era, IS was cognizant of equipment installations and perhaps got involved in vendor selection, but IS did not have responsibility for planning and managing the office automation activities.
- o INPUT believes the resistance to automating the office functions associated with interpersonal communications was lowered through the acceptance of the information center and personal computers. The white-collar workers have become familiar with the capabilities of the computer-based office systems products and have come to rely on these information resources.
- o The move is toward the integration of office systems with hardware and software products that provide:
 - Word processing.
 - Electronic mail.
 - Electronic filing.
 - Personal time management.
 - Financial modeling and spreadsheets.
 - Query and report preparation.
 - Data base management.
 - Graphic preparation.
 - Links to corporate data bases.

[The text on this page is extremely faint and illegible. It appears to be a list or a series of entries, possibly a table of contents or a list of items, but the specific details cannot be discerned.]

- o The supplies of products directed at the knowledge workers and information handlers are avoiding the term "office automation" in favor of titles that infer a more encompassing system. IBM choose "professional office systems", Data General went with "Comprehensive Electronic Office Systems" and DEC prefers "Multifunction Office Systems".
- o Because these office systems are designed for executives, management and professionals, as well as secretaries and other clerical support personnel, they become intertwined with the other end-user computing activities. Office automation will be viewed as a competitive weapon that can provide an edge in productivity and decision making.
- o With the scope of office systems expanding, there is an overlap between these systems and the services provided by the information center. IS management has recognized this overlap of functions and has, therefore, given the coordination of office systems to the information center manager.

D. END-USER CONSULTING SERVICES

- o As mentioned earlier, the emphasis of the information center will ~~revolve~~ ^{Focus} ~~around~~ ^{ON} providing the end-users ^{with} professional advice for formulating solutions to their business problems.
- o The end-user consultant should be able to grasp the business problem and select the most suitable alternative, which could be:
 - Standalone personal computer.
 - Mainframe decision support software.

THE UNIVERSITY OF CHICAGO
DEPARTMENT OF CHEMISTRY
5408 S. UNIVERSITY AVENUE
CHICAGO, ILLINOIS 60637

RECEIVED
JAN 15 1964

TO THE DIRECTOR
FROM THE DEPARTMENT OF CHEMISTRY

RE: [Illegible]

[Illegible text]

[Illegible]

[Illegible]

[Illegible]

- Micro-mainframe linkage.
 - Mainframe production system.
 - Office system.
 - Manual system.
- o Requests for information systems services from end users that are not certain about how the request might be satisfied, should be forwarded to an end-user computing consultant. It becomes the consultant's responsibility to analyze the request and evaluate the various alternatives.
 - o The use of hot-line services is becoming prevalent because of the trend toward end users attempting to formulate the solutions to their business problems directly from their workstations. Many questions can be answered by the consultants via a phone conversation.
 - o In large organizations that will require many end-user consultants, business units should have consultants assigned to them. This will foster working relationships and will allow the consultants to concentrate on specific business functions so that they can become more knowledgeable about the business dynamics.

E. THE MASSIVE TRAINING PROBLEM

- o Training and education have always been major issues facing the IS manager. The technology advances so rapidly it becomes extremely difficult to stay abreast of all of the changes. Keeping the IS professionals up-to-date and the corporate management familiar with the capabilities of the computer resources has been a big enough task. Now the IS manager is faced with even

Faint, illegible text at the top of the page, possibly a header or title.

Second block of faint, illegible text in the upper middle section.

Third block of faint, illegible text in the lower middle section.

Fourth block of faint, illegible text in the lower section.

Fifth block of faint, illegible text at the bottom of the page.

a bigger task--training and educating the end users in how to use and apply computer technology.

- o Exhibit III-3 shows that at each step of the end-user computing evolution (the specific time will vary among organizations) the number of end users requiring training will increase. Each new end-user computing initiative creates a larger training snowball. III-3

- o The original information center attracted a limited number of users, and training was accomplished mostly on a one-on-one basis. Personal computers have reached a much larger user population, making it necessary to investigate mass training methods. The new integrated office systems penetrate the work force even further and introduce a greater number of products. When personal computing, office systems, and production data processing systems become fully integrated, the technology will have to be learned by every executive, manager, professional, and administrative support ^{worker} personnel. This is becoming a serious problem for the information systems manager.

- o In the report Training: Prerequisite to End-User Computing INPUT recommends the establishment of a formal training and education function within IS that would have the responsibility for all IS training and education issues, including those associated with end-user computing. The support staff of the information center might conduct courses on specific end-user computing products, but planning and the selection of techniques and methods should be done by the formal training and education functions.

- o To date, training end-users on mainframe information center products and personal computers has been relegated to the vendors or the information center staff. INPUT doesn't believe that this approach will get the job done effectively. A formal group with various training techniques and methods, along with an overall training and education plan, will provide what is needed in this area.

IV I.S. MANAGEMENT'S VIEW OF THE INFORMATION CENTER

A. "GARBAGE CAN" FOR END-USER COMPUTING INITIATIVES

- o Inadvertently, the IS managers are creating new empires within their own empires by handing over the responsibility for any function related to end-user computing to the manager of the information center. The information center has become a garbage can for these rapidly emerging end-user computing initiatives, as depicted in Exhibit IV-1.
- o What started as a place where IS users could gain access to computer-stored data to satisfy some of their individual information analysis needs, has turned into a place where IS users can build integrated office systems with all the functionality (including communications) as has the host-based production applications systems.
- o This garbage can strategy only makes sense if there are policies and procedures in place that guard against user/information center systems development that circumvents the established standard system development methodologies.
- o If the users are starting to turn to the information centers to build transaction-driven systems, thereby avoiding the bureaucracy associated with the IS systems development staff, then it is time to reassess the goals and objectives of the information center and lay down guidelines that define

IV-1

THE UNIVERSITY OF CHICAGO

DEPARTMENT OF CHEMISTRY

PH.D. THESIS

BY

DR. [Name]

IN

THE

PH.D. PROGRAM

OF

THE

UNIVERSITY OF CHICAGO

CHICAGO, ILLINOIS

19[Year]

where end-user computing ends and ~~ten~~ standard systems development methodologies begins.

- o These systems development parameters should be established through the joint efforts of the IS manager, the manager of systems development, and the manager of end-user computing support. One of the primary responsibilities of the end-user consultants is to determine the most appropriate alternative for an information service request.
- o There is a fine line between giving the end users the flexibility to design and implement information systems and losing control of the information systems resources. The end users are on a path that parallels the evolution of data processing. Without proper guidance, the end users will repeat the same mistakes that the information systems services industry has encountered during the past 30 years.

B. STAFFING THE INFORMATION CENTER

- o The information center managers surveyed for this study believed their staffs should be double by 1987. This lends credence to the presumption that the IS managers are loading more responsibilities on the information center managers, brought about by the demands of the end users.
- o The job titles vary because norms have not been established and tasks keep expanding. The following is a representative sample of job titles found in the information centers survey for this study:
 - Information center consultant.
 - Information center product specialist.

Faint, illegible text, possibly bleed-through from the reverse side of the page.

Faint, illegible text, possibly bleed-through from the reverse side of the page.

- User consultants.
 - Business analyst.
 - Office technology trainers.
 - Personal computer analyst.
 - Information center analyst.
- o There is a definite differentiation between those people who service the PC users and those who service the mainframe users. This differentiation will diminish as microcomputers, mainframes, and office systems become more integrated.
- o Exhibit IV-2 lists the types of expertise that should be found in today's typical information center. The business consultants work with the end users in the formulation of a solution to an information systems problem. They should possess in-depth knowledge of the areas of the organization being serviced. Product specialists are just that; experts in the use of end-user computing tools. The technical support personnel of the information center are concerned with developing compatibility standards and guidelines for users to follow, along with the evaluation and selection of information center hardware (micro) and associated systems software (operating systems). The technical support staff should also be responsible for recommending LANS and linkage products to the telecommunication staff.
- o The size of the staff varies depending on the scope of the information center responsibilities. Where mainframe products, micro and office systems are under the purview of the information center, it's not unusual to find the information center representing more than 10% of the total IS population.

✓
IV-2

Faint, illegible text, possibly bleed-through from the reverse side of the page. The text is too light to transcribe accurately.

C. THE BACKLOG AND THE INFORMATION CENTER

- o The majority of the work generated for the information systems development staff falls under one of the following categories:
 - A new product line.
 - Regulatory changes.
 - Marketing innovations.
 - Customer service.
 - Operational efficiency.
 - Productivity improvements.
 - Application package implementation.
- o Information regarding the performance of the various business units of an organization is usually in the form of an on-line inquiry or a periodic report. This management information is normally designed into a production system as a byproduct of business transaction processing.
- o IS has always been weak in providing the business user with interactive decision support capabilities. Many financial analysts turned to the remote computer services vendors to build interactive financial models and perform "what if" analyses.
- o The advent of the information center has probably had little or no effect on the amount of work facing the systems development staff. What the information center (and related tools) has done is opening an entirely new information avenue to the end users' decision support.

MEMORANDUM FOR THE DIRECTOR, FBI

[Illegible]

- o The users are pleased with these new tools because they play an important role in improving an individual's daily performance, ^{a service that} which has heretofore not been available from IS. The users have, however, been able to satisfy some of their requests for new reports through the information center, but this has had an insignificant impact on the IS workload.
- o Overall, the backlog of requests for IS service has probably increased due to the shift of work from systems development to the information center. IS hardware and human resources are still being used to satisfy requests; the only thing that has changed is the form in which the service is rendered.

V WHERE IS THE INFORMATION CENTER GOING?

A. THE FUTURE CHARTER AND THE "BIG BANG" THEORY

- o During the next several years there will be more changes in the basic principles of how IS conducts its business than ^{have} ~~has~~ been seen since the introduction of the video display terminal in the 1960s. These changes will manifest themselves in the form of:
 - Standalone ^f Personal computers.
 - Personal computers sharing resources through LANS.
 - Personal computers communicating ^{and} exchanging data with other micros.
 - Micros linked to departmental processors.
 - Departmental processors linked to host mainframes.
 - Personal computers linked to host mainframes.
 - Distributed system development.
 - Electronic office systems.

1963 - 1964

MEMORANDUM FOR THE RECORD

On 10/15/63, the following information was received from the [redacted] regarding the [redacted] of [redacted] in [redacted] on [redacted].

1. [redacted]

[redacted]

2. [redacted]

[redacted]

3. [redacted]

[redacted]

[redacted]

[redacted]

- o The information services industry resembles the "big bang" theory of the universe. Just as the universe began as a tremendous, tightly-packed atom that exploded to create the galaxies, so has IS been a tremendous, tightly-packed atom of mainframes and support personnel. The explosion of microcomputers is forming galaxies of end-user computing. Some astronomers believe that once the universe reaches its maximum expansion it will start to contract to its original super-giant atom form.
- o The information systems universe reached its maximum expansion when users started bringing in microcomputers in every size, shape and form. It has now started to contract, evidenced by IS's steps toward tighter control over the proliferation of microcomputers, and the formation of end-user support groups.
- o Now the IS universe is at the stage of searching for the perfect balance of galaxies, which IS believes will involve an integrated network of computer resources ^{input} servicing ^{that} the information needs of individuals, departments, and corporate headquarters.
- o The information center, with its microcomputer and office systems support, represents a major step towards the integration of the information resource galaxies. The charter of the information center should be clearly defined and the necessary resources allocated for it to carry out its mission.
- o Eventually (possibly as early as 1990 for some organizations) the information center will be disbanded and the individual specialists will become a section within the systems development department. The business consultants of the information center will work with the system development staff to formulate solutions to information systems problems of the various business units of the corporation. The business consultants may become a part of the business units being serviced to act as a liaison and provide expertise on end-user computing products. End-user training will become the responsibility of the IS training department. Technical issues related to end-user computing will be assigned to the mainframe technical support group.

Faint, illegible text at the top of the page, possibly a header or introductory paragraph.

Second block of faint, illegible text, appearing to be a main body paragraph.

Third block of faint, illegible text, continuing the main body of the document.

Fourth block of faint, illegible text, possibly a concluding paragraph or a list of items.

Faint, illegible text at the bottom of the page, possibly a footer or signature area.

- o Because office automation crosses departmental lines, this activity will be handled by a separate group within the information systems development department. Specialist from the office automation group will be assigned to systems development projects to represent the needs of the office workers in the areas of interpersonal communications and administrative support. This coordination will become increasingly important as the information systems resources become more tightly integrated and more automation tasks are handled by departmental processors.

- o Arriving at an organizational structure that will facilitate the development of integrated data processing, end-user computing and office automation systems, and remain proactive to the needs of the individual end user will be the forthcoming challenge for IS management. These organizational issues will be examined in INPUT's report The Changing Dynamics of IS Organizations.

- o Until the time when information systems services becomes dispersed to departmental processors and microcomputers through integrated networks, there will be need for a separate end-user support group as outlined in Exhibit V-1. This group can be called the information center, or end-user support, or decision support, or any descriptive name, but it should be comprised of the following four functions:

V-1

- Technical support. This function is primarily responsible for evaluating available products in the end-user computing market for inclusion on the list of approved hardware and software resources for end users. These products include micro-mainframe links and LANS. End-user computing policies and procedures are also under this function.

- Marketing. This is a relatively new concept and encompasses the areas of promotion and general communications related to the services provided by the end-user support department. This function is

Faint, illegible text, possibly bleed-through from the reverse side of the page. The text is arranged in several paragraphs and appears to be a formal document or report. The content is mostly illegible due to the low contrast and blurriness of the scan.

responsible for assisting end users in selecting the best configurations of hardware and software. Marketing is also the IS coordinator for the formulation and function of any user's groups. The end-user computing newsletter is published by the marketing function.

- Office systems. This function conducts *for corporate office automation and provides* assessments, the planning and implementation assistance necessary to ensure *a* smooth transition from normal to automated systems. This function interfaces with the other corporate IS departments to assist in the management of resource utilization and to coordinate project integration.

 - Consultation. This function consumes at least 50% of the human resources of the information center. The consultants help *the* end users determine the best solution to their individual information systems problems and provide assistance *in* on the use and application of *the* specific end-user computing tools. *The* consultants can conduct one-on-one training sessions or they can conduct classroom courses on the available products.
- o In smaller organizations that can support only a few employees in the information center there will be an overlap of duties. The consultants in some information centers may be required to be involved in all four functions. Developing the right skills mix is a critical issue because of the limited human resources.

B. SKILLS MIX REQUIREMENTS

- o In the report Future Skills Requirements for Software Development INPUT stresses the need for people with interpersonal communications skills who have the capacity to learn the technology quickly and who have good business perspectives. *This is the* ~~These are the~~ types of candidates *a* that should be recruited for the group that works directly with end users.

Faint, illegible text at the top of the page, possibly a header or title.

Second block of faint, illegible text, appearing as several lines of a paragraph.

Third block of faint, illegible text, continuing the document's content.

Fourth block of faint, illegible text, possibly a transition or a new section.

Fifth block of faint, illegible text, appearing as a shorter paragraph.

Sixth block of faint, illegible text, possibly a concluding paragraph or a list.

Final block of faint, illegible text at the bottom of the page.

- o The individuals assigned to the information center function must enjoy assisting and tutoring others. They should be good teachers both as classroom instructors and ^{as} mentors. As good teachers they should be able to master new subjects (software packages) quickly.
- o Exhibit V-2 lists the primary skills that should ^{be required of those in} ~~comprise~~ the information center. It would be very fortunate, but very rare, to find an individual who possesses an adequate level of all of the skills required. Working with ^{the} users does require good ^{interpersonal} ~~people~~ skills and a grasp of the business functions being serviced. These are the top requirements, ^{followed} by technical competence. V-2 ✓
- o Where are IS managers finding these skills? The answer is, just about anywhere. INPUT's surveys for the information centers studies has ^{reve} uncovered a variety of sources for information center recruits, including:
 - Systems analysts.
 - Programmers.
 - Secretaries.
 - Administrative assistants.
 - Business/financial analysts.
 - Public school teachers.
 - Recent MBA graduates.

C. END-USER COMPUTING EVOLUTION

- o As shown ⁱⁿ Exhibit V-3 ^{COMPUTING} the information center is a major step in the overall evolution of end-user supporting. INPUT is predicting that by the early 1990s IBM's software strategies will be characterized by integration and identified as the Electronic Office period. The Electronic Office period will emphasize the integration of data processing, office automation systems, communications systems, and manual (paper-based) systems into electronic systems. V-3 ✓
- o End-user computing is on an evolutionary path that can best be described as progressive integration: the parts become more dependent upon the whole. As the Electronic Office period matures, more complex systems will evolve that will require a more global view of the information and decision support needs of the organization.
- o At each evolutionary phase of the Electronic Office period the merger between end-user computing and systems development becomes closer. As micros are integrated into networks, they become more dependent upon the whole in terms of performance and services required. End users will have the freedom to continue to build their own decision support systems in the Electronic Office period, but their interaction with other micro users and with other data bases will have to be planned and controlled. Even the software they will use will be more standardized to facilitate integration.

D. WILL THE NEED VANISH?

- o As micros play an increasingly ^{more} important role in the decision making process of ^{the} knowledge workers, the need for effective training programs and consulting service will grow. The need for a center where end users congregate to gain access to ^{the} information processing resources will vanish.

The first part of the report deals with the general situation in the country. It is noted that the economy is still in a state of depression and that the government is struggling to meet its obligations. The report also mentions the need for international assistance and the importance of maintaining peace and stability.

In the second part of the report, the author discusses the social and cultural conditions. It is observed that the population is suffering from poverty and ill health. The report also notes the need for social reforms and the importance of education and cultural development.

The third part of the report deals with the political situation. It is noted that the government is facing a crisis of confidence and that there is a need for a new government. The report also mentions the need for a constitution and the importance of democratic principles.

The fourth part of the report discusses the international situation. It is noted that the world is still in a state of tension and that there is a need for international cooperation. The report also mentions the need for a new international order and the importance of peace and stability.

The fifth part of the report deals with the future of the country. It is noted that the country has a bright future and that there is a need for a new government. The report also mentions the need for a constitution and the importance of democratic principles.

- o Most of the mainframe applications software vendors are providing interactive, bidirectional links from their mainframe packages to remote micros. Iterations of these products will make accessing mainframe data bases a simple, transparent process for the end users. Security and data integrity will not be a problem, because the existing mainframe packages will provide all of the necessary features and will threat micros as additional video display terminals. The major mainframe software vendors, such as IBM, Cullinet and Information Builders, are also marketing comprehensive microcomputer software to provide the end user mainframe capabilities on their microcomputers.
- o With the micro-mainframe integration becoming a reality, INPUT believes that future corporate information systems projects will take the microcomputer capability into consideration and take advantage of this resource. Future information systems builders will design the management information aspects of a system with the microcomputer as the primary server. This means that end-user computing will become an extension of the systems development function.
- o The end users will still require assistance with the development of their piece of a corporate system, but the consultants will be a part of the project development team rather than a separate information center. The emphasis will be on what the end user is trying to accomplish rather than how to use the microcomputer resource. The consultants will be oriented toward business analysis rather than the product expertise.
- o Computer-based training products will continue to improve and will have to become the primary method for teaching the end users how to use and apply micro resources. IS will maintain hotline services to answer specific questions about the application of PC hardware and/or software, but the instructor-led classroom environment will become too expensive to continue, as the use of micros become more commonplace.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for the integrity of the financial system and for the ability to detect and prevent fraud.

2. The second part of the document outlines the specific requirements for record-keeping, including the need to maintain original documents and to keep copies of all transactions. It also discusses the importance of regular audits and the need to report any discrepancies immediately.

3. The third part of the document discusses the consequences of failing to maintain accurate records, including the potential for fines and penalties. It also discusses the importance of training staff on proper record-keeping procedures and the need to establish a strong internal control system.

4. The fourth part of the document discusses the importance of maintaining accurate records of all transactions, including the need to maintain original documents and to keep copies of all transactions. It also discusses the importance of regular audits and the need to report any discrepancies immediately.

5. The fifth part of the document discusses the consequences of failing to maintain accurate records, including the potential for fines and penalties. It also discusses the importance of training staff on proper record-keeping procedures and the need to establish a strong internal control system.

6. The sixth part of the document discusses the importance of maintaining accurate records of all transactions, including the need to maintain original documents and to keep copies of all transactions. It also discusses the importance of regular audits and the need to report any discrepancies immediately.

- o INPUT believes the trend to offload ^gthe decision-making information processing activities on the micro will create a mainframe capacity problem. Even though ^{many}much of the management reporting and terminal inquiries will be replaced by decision support micro capabilities, ^gthe mainframes will become overloaded by micro-mainframe link activities. This quandary will be eased through the advent of departmental processors that will ^gservices the local end users and be integrated into the host network. These departmental processors will also handle the voice, image, text, ^{and}as well as the data systems of the future integrated electronic offices.
- o INPUT is predicting that the information center will be swallowed up by the integration of end-user computing, data processing, and office automation. This could be as early as 1990, ^gbut most certainly will take place by 1995.
- o This doesn't mean that IS should immediately halt all information center activities; ^gon the contrary, IS should continue to build a strong end-user support group, and at the same time, plan and schedule the steps toward the Electronic Office period.

VI

VI CONCLUSIONS AND RECOMMENDATIONS

A. CONCLUSIONS

- o The most active users of the information center ^{are} and those ^{people} associated with the middle management ranks. This includes managers, financial analysts, administrative assistants, and any other staff members that support middle management.
- o This middle management group represents the majority of the information center clientele, because it is where most of the micros can be found, and micro activities have become the responsibility of the information center manager.
- o When ^{the} microcomputers began to surface, IS management viewed them as nothing more than a glorified desk calculator. When management became concerned with the number of microcomputers being acquired and the variety of incompatible products being used, the problem was given to the information center to solve.
- o What is happening is that the information center is shifting its emphasis to ^{the} micro-related activities. The micro user base is growing so rapidly that training these people, who are scattered all over an organization, has become one of the major concerns.

MEMORANDUM FOR THE RECORD

DATE: 10/15/54

RE: [Illegible]

[Illegible]

[Illegible]

[Illegible]

- o Another end-user related service that is gaining momentum is the text, image, and voice processing aspects of office automation. Word processing, electronic mail, electronic filing, and automated administrative management are not only being accepted, they are becoming standard office methods. Because these services are directed at the end user, they too have been given to the information center to oversee.
- o The end-user computing evolution is picking up speed and the sharing of resources through LANs and multiuser microcomputer systems is the new wave, along with linking micros to mainframes. End users are starting to find ways to develop transaction-driven systems on their microcomputers, and bypass the IS and tape.
- o Vendors, including IBM, are seizing the opportunities created by the surge of interest in end-user computing and are developing products aimed at the integration of data processing, office automation, communication, and end-user computing. INPUT sees this integration coming to fruition in the early 1990s and is calling it the Electronic Office period.
- o Once the line between end-user computing and corporate systems development is erased by the Electronic Office period, new systems will be developed that will encompass the needs of all organizational levels, from corporate headquarters to the individual.
- o The central host mainframes will be unable to handle the processing load created by the Electronic Office period. The communications and mainframe loads will be alleviated by departmental processors. These processors will be linked to the mainframe and will service the local needs of work groups and individuals.
- o Once end-user computing becomes intertwined with production systems and office automation, the related issues will become the responsibility of the system development function, and the information center will disappear.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for the integrity of the financial system and for the ability to detect and prevent fraud.

2. The second part of the document outlines the specific requirements for record-keeping, including the need to maintain original documents and to keep copies of all supporting documents. It also discusses the importance of ensuring that records are accessible and retrievable.

3. The third part of the document discusses the importance of training and education for all personnel involved in the financial system. It emphasizes that proper training is essential for ensuring that all personnel are aware of the requirements and are able to perform their duties correctly.

4. The fourth part of the document discusses the importance of internal controls and the need to implement and maintain a system of internal controls that is effective in preventing and detecting fraud. It also discusses the importance of regular audits and the need to act on the results of audits.

5. The fifth part of the document discusses the importance of communication and the need to ensure that all personnel are aware of the requirements and are able to report any suspected fraud. It also discusses the importance of maintaining a culture of integrity and ethical behavior.

B. RECOMMENDATIONS

- o Exhibit VI-1 lists the action steps that should be taken in preparation for the Electronic Office Systems period.
- o ^{Moving} Getting from standalone micros and information centers to an integrated Electronic Office Systems environment is an evolutionary process and requires transitional steps. IS should continue to staff the information center with ^{the} these skills required to train and support end users. VI-1 ✓
- o The department responsible for IS training should evaluate the alternatives for training end users on micro and information center products and develop a training plan that will handle the anticipated increases in end-user computing.
- o The major mainframe software vendors ^{can} see the era of the integrated Electronic Office System approaching and are developing and marketing micro links as an extension ^{to} their mainframe products. Some are also making available micro software that will handle the needs of the individual and also interface with the mainframe software (e.g., Cullinet's Goldengate and IDM, McCormack and Dodge's PC Link, and IBM's Attachment systems). IS should install links that are compatible with their existing mainframe environment.
- o If not already in place, IS should install processors at the departmental level that are capable of accommodating office systems activity and micro integration. The following are some examples of vendors that have such systems.
 - IBM System/36, 4300s.
 - DEC All-In-1.

1948

...

...

...

...

...

...

- Data General; CEO.
 - Wang; Office.
- o Communications network planning must be able to handle the integration of departmental processors, host mainframes, LANs, and Micros.
 - o The end-user support function should not be isolated from the traditional systems development staff. These two groups must start collaborating. Each must be aware of the status of projects in the other group's area of responsibility.
 - o The integrated Electronic Office Systems period will cause a merger of the end-user support function into the systems development function and, therefore, IS organizational plans must identify how this will evolve. To start, the two functions should be reporting to the same manager.
 - o The end-user support and systems development staffs should jointly identify a business function within a department of the organization that would be a good prospect for a system designed around the capabilities of the microcomputers. The system should include production transaction processing and decision support that requires access to mainframe data.
 - o What the IS management is overlooking is an opportunity to exploit end-user computing rather than merely accommodate it. These new computing resources must be coupled with the major production systems to produce ultimate integrated information systems.
 - o The microcompute^r is in the process of eliminating the need for an information center, and the integrated Electronic Office System period will eliminate the need for a separate end-user support function. IS must be ready for each step of the end-user computing evolution.

[Faint, illegible text, likely bleed-through from the reverse side of the page. The text is too light to transcribe accurately.]
