INPUT[®]

Clients make informed decisions more quickly and economically by using INPUT's services. Since 1974, information technology (IT) users and vendors throughout the world have relied on INPUT for data, research, objective analysis and insightful opinions to prepare their plans, market assessments and business directions, particularly in computer software and services.

Contact us today to learn how your company can use INPUT's knowledge and experience to grow and profit in the revolutionary IT world of the 1990s.

SUBSCRIPTION SERVICES

- Information Services Markets
 - Worldwide and country data
 - Vertical industry analysis
- Business Integration Markets
- Systems Integration and Professional Services Markets
- Client/Server Software Platforms
- Outsourcing Markets
- Information Services Vendor Profiles and Analysis
- Electronic Commerce/Internet
- U.S. Federal Government IT Markets
- IT Customer Services Directions (Europe)

SERVICE FEATURES

- Research-based reports on trends, etc. (Over 100 in-depth reports per year)
- Frequent bulletins on events, issues, etc.
- 5-year market forecasts
- Competitive analysis
- Access to experienced consultants
- Immediate answers to questions
- On-site presentations

DATABASES

- Software and Services Market Forecasts
- Software and Services Vendors
- U.S. Federal Government
 - Procurement Plans (PAR)
 - Forecasts
 - Awards (FAIT)
 - Agency Procurement Requests (APR)

CUSTOM PROJECTS

For Vendors—analyse:

- Market strategies and tactics
- Product/service opportunities
- Customer satisfaction levels
- Competitive positioning
- Acquisition targets

For Buyers—evaluate:

- Specific vendor capabilities
- Outsourcing options
- Systems plans
- Peer position

Abstract

The purpose of this report is to track the key trends in the European information systems outsourcing market and to provide a comprehensive forecast of the size of the market over the period 1995-2000. In addition, the report forecasts the changing pattern of demand, and hence service types, within Europe.

The report provides:

- An analysis of the changing nature of the European information systems outsourcing market, including a discussion of the evolution of key motivations for outsourcing over the forecast period
- Analyses of the nature of the outsourcing opportunity within each of the major industry sectors
- Forecasts by delivery mode for Europe and each individual country
- Forecasts of the information systems outsourcing market by industry.

Introduction

A

Scope and Objectives

Despite a reduction in growth in the platform operations segment, growth in the European outsourcing market still shows no signs of slackening. The reduction in growth in the platform operations segment is being more than counterbalanced by an increasing acceptance of strategic outsourcing by major organisations throughout Europe, and by the demand for external management of client/server IT infrastructures.

The objectives of this report are:

- To identify the major market trends taking place in the European outsourcing market
- To forecast the size of the European outsourcing market by delivery mode, industry and country
- To identify the key business pressures and outsourcing trends within a number of key industry sectors.

Outsourcing is defined by INPUT as follows:

Outsourcing is a long-term relationship (greater than one year) between a client and vendor in which the client delegates all, or a major portion, of an operation or function to the vendor. The operation or function may be solely Information Systems Outsourcing-based, or may merely include Information Systems Outsourcing as a prominent component of the operation (at least 30% of the budget).

The critical components defining an outsourcing service are:

- Delegating an identifiable area of the operation to a vendor

- Single vendor responsibility for performing that delegated function
- Intended, long-term relationship between the client and vendor
- Contract term of at least one year
- Client's not intending to perform this function using internal resources
- The contract may include non-Information Systems Outsourcing activities, but Information Systems Outsourcing must be an integral part of the contract
- Outsourcing is a collection of services integrated under a single, long-term contract with one vendor responsible for its operation and management.

Business Operations Outsourcing (also known as Business Outsourcing or Functional Outsourcing) is a relationship in which one vendor is responsible for performing an entire business/operations function including the Information Systems Outsourcing that supports it. The Information Systems Outsourcing content of such a contract must constitute at least 30% of the total annual expenditure in order for INPUT to include it in the Business Operations Outsourcing market.

Information Systems (IS) Outsourcing can be viewed as a component of the Business Operations Outsourcing market (i.e., Information Systems Outsourcing is a business/operations function, see Exhibit I-1). However, in order to distinguish between outsourcing contracts that are solely IS versus those that include IS as well as other functions, IS Outsourcing will be separated from Business Operations Outsourcing. Information Systems Outsourcing is divided into four service components as shown in Exhibit I-2.

- *Systems Operations Outsourcing* describes a relationship in which a vendor is responsible for managing and operating a client's computer system/datacentre (*Platform Systems Operations*) or developing and/or maintaining a client's application as well as performing Platform Operations for those applications (*Applications Systems Operations*).
- *Desktop Services* is a relationship in which a vendor assumes responsibility for the deployment, maintenance and connectivity of personal computers, workstations, client/server and LAN systems in the client organisation. To be considered as Desktop Services Outsourcing, a contract must include a significant number of the individual services listed below.

- Software Product Supply
 - Equipment Supply
 - Equipment/Software Installation
 - Equipment Maintenance
 - LAN Installation and Expansion
 - LAN Management
 - Network Interface Management
 - Client/Server Support
 - Logistics Management
 - User Support
 - Help Desk Functions
 - User Training and Education
- *Network Management Outsourcing* is a relationship in which a vendor assumes full responsibility for operating and managing the client's data telecommunications systems. This may also include the voice, image and video telecommunications components.
 - *Application Management* is a relationship in which the vendor has full responsibility for developing and maintaining all of the application or function.

Exhibit I-1

Business Operations Outsourcing

Exhibit I-2

Information Systems (IS) Outsourcing Service Categories

The above definitions focus on the services covered in the outsourcing contract. For example, an Application Operations contract can include all facets of Information Systems Outsourcing (platform operations, desktop services, network and application management). The key to INPUT's market definition is the service contract. If a customer only wants to outsource the network, it is Network Management Outsourcing. If an airline, for example, wishes to outsource their reservation operation which includes not only the network, but also its infrastructure, applications and the people running the operation, this is a Business Operations Outsourcing contract. Exhibit I-3 shows the service components that may be included in each outsourcing service category.

Exhibit I-3

Outsourcing Service Components

Component	Platform Ops	Appl. Ops.	Desktop Services	Network Mgt.	Appl. Mgt.	Business Ops.
Project/Contract Management	X	X	X	X	X	X

LAN Management		X	X	X		X
WAN/MAN Management		X		X		X
Transaction Processing Services		X				X
Other Professional Services		X	X		X	X
Business Process Operations						X

Source: INPUT

The largest, most visible contracts awarded over the past year have been typically Application Operation outsourcing contracts since they, at least, included management of the infrastructure (datacentres and various computing platforms) and the support of some legacy applications. In the past, most Application and Platform Operation outsourcing contracts included network management but recent contracts have also included desktop services.

What is not included in INPUT's world of outsourcing are the following:

- Project-based services are not considered as part of outsourcing. Thus, Systems Integration and application development projects are not included

- Services that were never intended to be performed internally. Maintenance-only services do not constitute an outsourcing function by themselves. However, responsibility for hardware and software maintenance is inherent in most outsourcing contracts
- Processing services contracts of less than one year
- Voice-only network management
- Business operations with minimal information systems content. For example, the outsourcing of the marketing communication function to an outside agency is not covered by INPUT's analysis. A function or business operation must have at least 30% of its budget attributed to information technology, in order to be included.

B

Methodology

The data shown in this study was derived from the following combination of sources:

- A vendor research programme of over 500 interviews with key software and services vendors across Europe
- A further 1,000 vendor and user interviews across all European market sectors to determine trends and opinions
- INPUT's continuous analysis of the delivery modes and vertical industry sectors comprising the computer software and services market
- INPUT's extensive library and database of information relating to the European outsourcing market.

In addition, further interviews with representatives of 88 organisations were carried out across a number of industry sectors to determine the key pressures on these sectors and their relative propensity to adopt each of the various modes of IT outsourcing.

These interviews were spread across organisations in France, Germany, and the U.K. and between senior non-IT executives, such as chief financial officers, and IT managers.

The interviews were divided across industry sectors as shown in Exhibit I-4.

Exhibit I-4

Interview Profile by Industry

Sector	Number of interviews
Banking and finance	17
Insurance	6
Discrete manufacturing	23
Process manufacturing	22
Retail distribution	5
Wholesale distribution	4
Transportation	11
Total	88

Source: INPUT

All interviews were carried out with organisations with annual revenues in excess of \$100 million.

While the number of interviews within some of these sectors is significantly lower than others, these interviews have been used to give an indication of business pressures and attitudes to outsourcing across each sector listed.

C**Report Structure**

Chapter II consists of the Executive Overview which is a summary of the key findings of the report.

Chapter III provides forecasts of the European outsourcing market by delivery mode.

Chapter IV provides a forecast of the European outsourcing market by industry sector and analyses the nature of outsourcing opportunities within each of the following sectors: banking and finance, insurance, discrete manufacturing, process manufacturing, retail distribution, wholesale distribution and transportation.

For each sector, it analyses:

- Key business pressures

- The key IT challenges
- Areas of satisfaction and dissatisfaction with IT functions performed in-house
- The perceived necessity of performing individual IT functions in-house
- Key outsourcing opportunities.

Chapter V provides forecasts by delivery mode for each individual country market. Forecasts by industry sector are provided for France, Germany, U.K., Italy and Sweden.

A

Growth in European Outsourcing Market Remains Strong

Outsourcing is still often portrayed as a short-term phenomenon, concerned primarily with tactical cost reduction exercises. From this viewpoint, it is argued that outsourcing is close to reaching saturation point and the use of outsourcing will begin to decline as the major European economies return to growth, as businesses recover their confidence and as organisations learn how to increase the productivity of their own datacentres.

However, the evidence in the market does not appear to support this case. In practice, growth in the European outsourcing market remains strong. In the short term, major contracts recently signed in Germany, Italy and the U.K. assure considerable outsourcing revenue growth during 1995 in these countries. However, the evidence also points to strong growth in outsourcing for the remainder of the century, at least. Throughout Europe, medium-term growth in outsourcing is being fuelled by:

- The increasing propensity of large organisations to use outsourcing strategically rather than tactically
- Vendors' growing ability to offer sophisticated management of client/server IT infrastructures.

This Executive Overview discusses these two major growth drivers and the pattern of outsourcing that is emerging by industry sector. For example, the insurance and discrete manufacturing sectors are in the forefront of those sectors taking a more strategic approach to outsourcing, while the process manufacturing and retail sectors show a comparatively high propensity to outsource the management of their distributed IT infrastructures.

INPUT's overall forecast for the European outsourcing market is shown in Exhibit II-1.

Exhibit II-1

This forecast includes both IS outsourcing and business operations outsourcing.

Growth is forecast to be strongest in the European outsourcing market over the next two years, with growth of 25% in 1995 and 22% in 1996. By the year 2000, the annual growth rate is forecast to decline to 17%.

B**Increased Use of Strategic Outsourcing**

Much activity in the outsourcing market is still primarily associated with cost reduction and the transition from centralised to decentralised IT infrastructures. For example, the British Aerospace contract was primarily driven by a desire for cost reduction and a short-term capital injection rather than a desire to reengineer the manner in which IT was applied to the organisation's business.

However, there are other contract examples, particularly in the insurance sector, where the need to rethink the application of IT to the organisation's business has been of considerable importance.

Exhibit II-2 illustrates the manner in which the driving forces responsible for the adoption of outsourcing are changing.

Exhibit II-2

Evolution of Outsourcing Motivations

Motivations for Outsourcing	1995	2000
Managing transition between architectures	***	*
Cost reduction/capital injection	****	**
Technical complexity	**	****
Re-application of IT to the business	**	*****
Outsourcing of non-core processes	*	*****

Source: INPUT

Overall, there is currently a very high level of enthusiasm for IT in Europe. Many European executives now recognise the potential of information technology to assist proactively in the reengineering of key business processes and are increasingly prepared to be more aggressive in their use of IT. However, many organisations are experiencing difficulty in implementing such a strategy. The main IT issue for major organisations in Europe at the present time is their effectiveness in applying IT to business processes to gain commercial advantage.

Accordingly, some organisations are turning to outsourcing vendors whom they believe to possess greater experience in applying information technology within their industry sector.

The concepts of IT outsourcing and business reengineering are perceived to have strong cultural compatibility and to share a number of common themes such as cost-saving, increased flexibility and improved core-business focus.

Indeed, the characteristic that distinguishes many outsourcing clients from other organisations is not a desire to lessen the role of IT within their organisations, but a combined need to use IT more effectively while simultaneously reducing their IT expenditure. Overall, organisations adopting outsourcing are more likely than their counterparts to increase their use of information technology.

At the same time, organisations are becoming increasingly prepared to outsource entire business processes that are either non-core or not performed to a world-class standard in-house.

These changes in the market necessitate a corresponding change in skill mix by vendors, as shown in Exhibit II-3.

Exhibit II-3

Vendor Skill Requirements

Skill	1995	2000
Technical capability	*****	***
Ability to identify process improvements	***	*****
Business process management	**	*****

Source: INPUT

At present, users perceive vendors as possessing low levels of ability to identify business process improvements. This must change as clients place increasing emphasis not on technical skills but on the ability to effectively apply technology in pursuit of corporate goals.

Over the forecast period, organisations will also seek to outsource non-core business processes in their entirety. At present, this trend is most noticeable within the North Sea oil operators and the U.K. public sector. Indeed, the Treasury in the U.K. is attempting to use outsourcing as a key vehicle to solve the problems traditionally faced by major projects carried out on behalf of central government departments. These projects have often:

- Not been implemented on time or to budget
- Not delivered the organisational benefits anticipated.

Outsourcing projects carried out within the Public Finance Initiative address these issues by requesting delivery of an operational service over a prolonged period rather than completion of a project. This places the onus on the supplier:

- To finance any initial capital investment costs
- To assume the risks associated with budget overruns and late delivery
- To ensure that any systems developed are initially fit for purpose and subsequently enhanced to maintain a high level of operational performance.

However, opportunities are also beginning to emerge elsewhere, notably in the insurance sector which is undergoing a period of major structural change.

C

Increased Vendor Client/Server Management Capability

The other major trend in the European outsourcing market is the increasing proportion of outsourcing related to client/server architectures rather than datacentres. This includes both development activity based around client/server architectures and the ongoing management of distributed IT infrastructures.

Exhibit II-4 shows the forecast growth in the European outsourcing market separated into:

- Legacy system management, including datacentre management and the application maintenance management of legacy applications
- Client/server management, including distributed systems management and the development of new applications based on client/server architecture
- Business process outsourcing.

Exhibit II-4

Outsourcing Service Trends

As a result of the changing nature of clients' motivations for outsourcing, legacy system management is forecast to grow much more slowly by (an average of 9% per annum) than outsourcing based around client/server system development and management (average annual growth 28% per annum). Between 1995 and 2000, the proportion of the European outsourcing market accounted for by legacy system management is forecast to decline from 50% to 30%, while the proportion related to client/server architectures will increase from 45% to 63%.

At the same time, there will be an increasing emphasis on new systems development within outsourcing contracts.

One of the major factors in the growth in the desktop services market is the increasing sophistication of the major vendors in managing this environment.

So far, few organisations have adopted desktop services outsourcing on the basis of reduced costs. Their motivations have principally been the difficulty associated with managing the desktop environment across

numerous geographically dispersed locations or their need to guarantee high service levels for critical business systems. As vendors develop their remote management capability, they will be in a stronger position to offer users improved service levels with real cost reductions.

Vendor remote management capability will become well-established over the next year, extending the scope of desktop services outsourcing, and making it a more appropriate option for large numbers of medium to large organisations.

Exhibit II-5 provides a forecast of the growth in the European outsourcing market by segment.

Exhibit II-5

Outsourcing Market Segments, Europe 1995-2000

Desktop services outsourcing will, with business operations, show the highest growth rate over the next five years. After platform operations, network management is expected to show the slowest growth rate over the forecast period.

This is not because of a lack of demand. Indeed, the network infrastructures of many organisations are now out-of-date and in major need of technological refreshment. Often, they lack the throughput required to support the anticipated growth in network traffic over the next few years and have an inappropriate topology to support the organisations' emerging client/server architectures.

However, in the short-term, vendors will have difficulty in meeting this demand. In particular, they will struggle to demonstrate the specific international coverage required to meet the needs of major organisations, comprehensive support for both wide and local area networks, and their ability to supply technological refreshment for wide area networks within an acceptable timescale.

Accordingly, for the purposes of the outsourcing forecast, it has been assumed that there will be an interval of several years before the market for network management becomes widely established in Europe.

D

Insurance and Manufacturing Sectors Take Strategic Approach to Outsourcing

Exhibit II-6 provides a forecast for the European outsourcing market by industry sector. The forecasts shown in this exhibit include both business operations outsourcing and SAP outsourcing in addition to IS outsourcing.

Exhibit II-6

European Outsourcing Industry Sector Forecast

The manufacturing sector has always been at the forefront in the use of outsourcing in Europe, and is forecast to remain so over the forecast period. However, the nature of outsourcing in the manufacturing sector is now changing significantly in Europe, with a shift in emphasis from tactical to strategic outsourcing. Many of the early contracts in the manufacturing sector were primarily concerned with phasing out mainframe datacentres or reducing their cost.. While these are still important concerns within the sector, recent deals indicate an increasing willingness to outsource additional systems development functions and to seek external assistance in deriving organisational benefits from information technology.

At the present time, organisations in the discrete manufacturing sector typically hold their own internal IT capabilities in low esteem and appear to display the lowest commitment of any sector to maintaining their own in-house IT activity. Consequently, the demand for outsourcing will remain high in the manufacturing sector.

In the U.K., the public sector is now the biggest user of outsourcing. However, most of this demand has been the result of central government coercion rather than an inherent desire to adopt outsourcing from the departments and local authorities concerned. Nonetheless, this will remain a major growth area with the Public Finance Initiative producing major outsourcing opportunities for vendors in central government and the health service at least over the life of the present administration. Similarly, the deadlines for Compulsory Competitive Tendering in local government will lead to major growth in this sector. However, governments in countries such as France and Germany have so far not copied the U.K. in adopting similar measures. France may be the most likely of the two to do so in the short-term as a consequence of the recent presidential election.

The banking and finance sector still tends to have a much higher regard for IT as a core activity than does the manufacturing sector. Consequently the scope of outsourcing contracts within the banking sector has typically been much less than that in the manufacturing sector.

However, until recently, the insurance sector also appeared to regard IT as an activity best conducted in-house. However, the sector is now undergoing major change and this has resulted in a number of very large applications operations contracts in Europe within the last year. These contracts will have a major impact on the value of outsourcing revenues from the insurance sector in 1995.

In the U.K., much of the structural change in the utilities sector has already occurred, reducing the future new opportunities there. However, the utilities sector remains an area of potential high growth elsewhere in Europe.

Traditionally, outsourcing has been primarily a horizontal activity delivered with little differentiation from industry to industry. However, as reengineering begins to become a major driver for outsourcing, so vendors have begun to restructure their outsourcing activities along industry lines.

In addition, while all industry sectors are, to some extent at least, potential prospects for all types of outsourcing, some industry sectors are more advanced in their adoption of certain outsourcing services than others. Exhibit II-7 indicates the types of service that are especially favoured by each of a number of key industries.

Exhibit II-7

Key Opportunities by Industry Sector

Sector	Platform operations	Desktop services	Network management	Application management	Applications operations
Banking and Finance		X		X	
Insurance				X	X
Discrete manufacturing					X
Process manufacturing		X	X		
Retail distribution		X	X	X	
Wholesale distribution	X	X			
Transportation			X		X

Source: INPUT

For example, the banking and finance sector has so far shown a low propensity to outsource key datacentres but shows a comparatively high level of acceptance for desktop services outsourcing and the management of groups of applications.

At present, the insurance and discrete manufacturing sectors have the lowest regard for IT as a core in-house activity, and have a major need to become more effective in their use of IT. As a result, leading organisations in both of these sectors have recently entered into major applications operations contracts with outsourcing vendors.

At present, the organisations with the highest propensity to adopt desktop services and network management outsourcing are those with highly geographically dispersed operations such as the retail and process manufacturing sectors.

The initial business operations opportunities in Europe have occurred in the sectors that are most culturally attuned to outsourcing, namely the oil companies in the process manufacturing sector and the U.K. government.

(Blank)

Europe — Outsourcing Growth Boosted by Changing Service Patterns

A

Desktop Services and Business Operations will have Highest Growth Rates

Exhibit III-1 forecasts the European IS outsourcing market by delivery mode over the period 1995-2000.

Exhibit III-1

IS Outsourcing, Europe 1995-2000

	Market Forecast (US\$ millions)				
	1994	Growth 94-95 (%)	1995	Growth 1995-2000 (%)	2000
Platform Operations	1050	14	1200	11	2000
Desktop Services	490	33	650	27	2150
Network Management	550	10	610	16	1250
Applications Management	230	25	290	24	850
Applications Operations	2080	31	2700	21	7000
Total IS Outsourcing	4400	24	5450	19	13300
Business Operations	200	50	300	27	1000
Total Outsourcing	4600	25	5750	20	14300
SAP Outsourcing	350	14	400	9	620

Source: INPUT

This chart provides a complete forecast for outsourcing including the business operations activity carried out by IT services vendors and SAP outsourcing activity. INPUT classifies traditional SAP R/2 outsourcing as a processing service, though this is changing as R/3 outsourcing emerges.

The following charts in this chapter exclude both business operations outsourcing and SAP outsourcing. A large part of the current business operations activity in Europe is currently concentrated in the U.K., particularly in the public sector, whereas SAP outsourcing is still primarily concentrated in Germany.

B

Outsourcing Growth Remains Strong Throughout Europe

Exhibit III-2 provides forecasts for the IS outsourcing market by country over the period 1995-2000. Neither business operations nor SAP outsourcing are included in the figures shown in this exhibit.

Exhibit III-2

IS Outsourcing Country Markets, Europe 1995-2000

		Growth 94-95		Growth 95-00	
	1994 (\$m)	(%)	1995 (\$m)	(%)	2000 (\$m)

Ireland	15	20	18	18	42
Eastern Europe	23	31	30	21	80

Because of rounding, data may not add to totals. CAGRs are calculated on pre-rounded values.

Source: INPUT

Growth rates for IS outsourcing are forecast to remain strong across Europe. There are no signs of demand slackening in the more mature markets such as the U.K. and France, and there is still a growing acceptance of the role of outsourcing in many of the less developed markets.

However, the service pattern varies somewhat from country to country. Typically, the more advanced outsourcing markets are seeing increasing emphasis on reengineering and desktop services, while outsourcing activity in the less mature markets is still primarily focused on cost reduction and facilitating transition between centralised and decentralised IT architectures.

Outsourcing revenues in Germany and Italy will increase significantly in 1995 as a result of major contracts signed in 1994.

C

Platform Operations Shows Declining Growth Rates

Exhibit III-3 provides forecasts for the platform operations market by country over the period 1995-2000.

Exhibit III-3

Platform Operations Country Markets, Europe 1995-2000

		Growth 94-95		Growth 95-00	
	1994 (\$m)	(%)	1995 (\$m)	(%)	2000 (\$m)

Ireland	8	18	9	15	18
Eastern Europe	9	35	12	23	35

Because of rounding, data may not add to totals. CAGRs are calculated on pre-rounded values.

Source: INPUT

The platform operations market is driven by the desire to reduce the cost of running mainframe datacentres and by the need to phase out mainframes in favour of more distributed IT infrastructures.

These driving forces are being replaced in the more developed outsourcing markets by an emphasis on re-applying IT to the business. Consequently, the overall European growth in platforms is reducing and the growth rates are lowest in the more sophisticated outsourcing markets such as the U.K., France and Germany.

In addition, many organisations are consolidating their mainframe datacentres in-house, making the justification of outsourcing on cost reduction grounds a more difficult proposition for vendors.

D**Desktop Services — The New Face of IT Infrastructure Outsourcing**

Exhibit III-4 provides forecasts for the desktop services market by country over the period 1995-2000.

Exhibit III-4

Desktop Services Country Markets, Europe 1995-2000

		Growth 94-95		Growth 95-00

Source: INPUT

Desktop services is the new face of IT infrastructure outsourcing, which is just becoming established in Europe. So far, desktop services outsourcing has tended to be adopted only by organisations, such as merchant banks, with extremely critical applications running over LANs or by organisations with a large number of LANs spread over hundreds of sites, where the in-house IT support group has lacked the means to provide enterprise-wide support.

However, a number of vendors are now building pan-European, or global, desktop support infrastructures which will, over the next few years, enable them to offer comprehensive remote management of LANs and client/server infrastructures. In addition to the management of technical complexity on behalf of clients, this will lead to considerably reduced desktop support costs, which will provide a major boost to the desktop services outsourcing market.

Although the first contracts for desktop services outsourcing were signed in the U.K., desktop services outsourcing is now becoming rapidly established throughout Europe. The market for desktop services is already growing apace in the major countries, though it may take longer to become established in some of the smaller countries. In some of the smaller countries, desktop services will initially be inhibited by the absence of large corporations. Desktop services outsourcing currently requires a minimum critical mass of approximately 500 workstations, which makes it applicable mainly to medium to large organisations.

However, as vendors continue to build their expertise in remote systems management, remote management will become feasible for smaller numbers of workstations and, hence, smaller organisations.

E

Network Management Growth Restrained by Supplier Capability

Exhibit III-5 provides forecasts for the network management market by country over the period 1995-2000.

Exhibit III-5

Network Management Country Markets, Europe 1995-2000

		Growth 94-95		Growth 95-00	
	1994 (\$m)	(%)	1995 (\$m)	(%)	2000 (\$m)
Europe	550	10	600	16	1250

Greece	1	10	1	14	1
Ireland	2	10	2	14	3
Eastern Europe	3	10	3	17	7

Because of rounding, data may not add to totals. CAGRs are calculated on pre-rounded values.

Source: INPUT

There is currently a strong need for network management in Europe. Many organisations are now facing a similar situation in wide area networks to that which they faced in their datacentres five to ten years ago. In particular, many corporate data networks lack the throughput required to support interconnected LANs and new technologies such as multimedia. They are also implemented in inappropriate topologies for support of client/server infrastructures and in legacy technologies.

Accordingly, many organisations would ideally like to replace their existing networks with a more flexible and appropriate form of network support. Unfortunately, this is difficult for them to achieve, since services that would satisfy this demand are not extensively available in Europe.

Extensive outsourcing of wide area networks in Europe requires vendors to establish flexible pan-European networks based on technologies such as ATM. Accordingly, the growth in the network management market will be delayed, not by the potential demand, but by vendor capability. Network management will become more quickly established in the more deregulated markets in Europe and will be slower to take off in countries such as Germany.

However, the potential demand for WAN outsourcing is very strong. Indeed, many users would like to appoint a single vendor to provide management of their combined LAN and WAN infrastructures.

F

Application Management Shows High Growth in Major Economies

Exhibit III-6 provides forecasts for the application management market by country over the period 1995-2000.

Exhibit III-6

Application Management Country Markets, Europe 1995-2000

		Growth 94-95		Growth 95-00

Because of rounding, data may not add to totals. CAGRs are calculated on pre-rounded values.

Source: INPUT

A number of vendors such as FI Group and Hoskyns in the U.K. have offered application management as a separate service for several years. However, while these vendors have shown high levels of growth in these activities, many vendors have been slow to realise the potential of application management.

Application management is expected to show very high levels of growth over the forecast period for two reasons:

- Firstly, in-house IT departments are facing considerable pressure to focus on improving their organisation's use of IT, rather than focusing on the support of existing systems. The latter is clearly not an area of strategic importance for the organisation and can be outsourced to an external partner. When such activities are outsourced, users often discover both cost savings and an improvement in application-related service levels
- Secondly, the technologies and mechanisms by which new systems are developed and implemented are changing rapidly. Even though an internal IT department may be the appropriate organisation to assist users in the identification of new applications, they may not be the most appropriate organisation to rapidly design and implement the system.

Application management is now spreading from the U.K. to the other major countries in Europe, strongly promoted by Cap Gemini Sogeti. This is encouraging other national systems houses to follow suit.

G

Applications Operations Boosted by Increasing Emphasis on Reengineering

Exhibit III-7 provides forecasts for the applications operations market by country over the period 1995-2000.

Exhibit III-7

Applications Operations Country Markets, Europe 1995-2000

Source: INPUT

The applications operations market will continue to grow rapidly over the forecast period. Some of this growth is at the expense of the platform operations market, as the principal drivers of IS outsourcing in Europe shift from factors overwhelmingly concerned with cost reduction to factors related to improving the effectiveness with which IT is applied in support of business goals.

A significant number of large applications operations contracts of this type have been awarded recently, including the EDS contract with INA and the IBM Systeme-und Netze contract with Gothaer Versicherungen AG. These contracts will have an immediate impact on the growth rate of applications operations revenues in Italy and Germany respectively.

Industry Sector Analysis

Section A of this chapter contains a forecast of the European outsourcing market by industry sector. Sections B - H contain discussions of the business pressures and outsourcing trends within a number of key industry sectors.

A

Industry Sector Forecast — Europe

Exhibit IV-1 provides a forecast for the European outsourcing market by industry.

Source: INPUT

The manufacturing sector has been at the forefront of the adoption of outsourcing in Europe and is generally one of the key sectors when outsourcing begins in each country. Despite its role in the vanguard of outsourcing, there are no signs of a major slackening of growth in the manufacturing sector. In fact, the nature of outsourcing within the manufacturing sector appears to be changing from the tactical, short-term use of outsourcing to assist architectural migrations to a more strategic use of outsourcing. This change in attitude is resulting in major applications operations contracts being awarded by some of the larger manufacturing groups.

The financial services sector has been reluctant to adopt outsourcing to the same degree. However, the sector has now begun to use outsourcing tactically to support the management of its desktop services and networks. In addition, there are signs that the sector is on the verge of accepting a more strategic role for outsourcing. The insurance sector is now facing major structural change and high levels of competitive pressure. Consequently, during the last year, several large insurance companies have awarded major applications operations contracts. This trend is forecast to continue.

Outsourcing in the government sector has grown very rapidly in the U.K. over the past two years, with the central government outsourcing market now larger than that in local government. This trend will continue strongly during 1995 with a strong emphasis on the Private Finance Initiative. Governments in France and Germany have yet to adopt similar philosophies and approaches. In the short-term, following the change of government, significant opportunities are more likely to arise in France than in Germany.

B**Banking and Finance — IT Still Regarded as Core Business Activity**

Exhibit IV-2 lists the principal business pressures on the European banking and finance sector, and Exhibit IV-3 identifies key areas for action in this sector.

Exhibit IV-2

Principal Business Pressures: Banking and Finance

Exhibit IV-3

Key Actions: Banking and Finance

Overall, there is widespread recognition of an increase in competition in the banking sector. Some of this competition is coming from new players moving into financial services and from foreign institutions. Financial institutions are increasingly seeking to expand their international activities.

While there is a recognition of the need for improved cost-effectiveness of service delivery in the banking and finance sector, the principal focus is on the need to improve customer service. Accordingly, many banking

organisations wish to use information technology primarily to strengthen their service provision and their relationships with major clients rather than reduce internal costs.

Another major theme in the banking sector is the desirability of using IT to introduce new services. However, a number of organisations have historically found IT to be an impediment rather than a facilitator in this respect.

The most important IT challenges facing organisations in the banking and finance sector are listed in Exhibit IV-4 and the least important challenges in Exhibit IV-5.

Exhibit IV-4

Most Important IT Challenges: Banking & Finance

Sample of 17 respondents. Standard error = 0.2

Source: INPUT

Exhibit IV-5

Least Important IT Challenges: Banking & Finance

Sample of 17 respondents. Standard error = 0.3

Source: INPUT

These exhibits indicate that the major challenge facing organisations in the banking sector is the need to apply IT proactively in support of an organisation's business development goals.

Exhibit IV-6 lists the most satisfactory attributes of IT departments belonging to organisations in the banking sector and Exhibit IV-7 lists their least satisfactory attributes.

Exhibit IV-6

Areas of Highest Satisfaction: Banking & Finance

Exhibit IV-7

Areas of Lowest Satisfaction: Banking & Finance

Sample of 17 respondents. Standard error = 0.3

Source: INPUT

Overall, the IT departments within banking institutions are perceived to combine a high level of business understanding with a strong knowledge of new technology. While there remains scope to improve the cost-effectiveness of IT departments, their major failings are the time taken to develop and implement new applications and their comparative focus on head office.

The principal opportunities created for outsourcing vendors are services that enable the client to implement systems more rapidly and in a manner which extends their geographic support. Accordingly, the major growth areas in the banking and finance sector will remain applications management and client/server systems management.

Applications management services offer two potential key benefits to the banking sector:

- Firstly, application maintenance management enables organisations to subcontract ongoing support for current applications with the result that a higher proportion of internal resources can be dedicated to new systems development and implementation

- Secondly, as vendors move to using rapid development methodologies and build up libraries of re-usable objects for specific applications, banking institutions will increasingly hand over responsibility for development and implementation to external vendors. The in-house IT department will focus more of its energy on identifying key opportunities for the deployment of IT.

Banking organisations will require client/server systems management support to assist them in managing their geographical complexity. This need will increase in importance as financial institutions extend their services outside their own countries of origin and will encompass both desktop services and wide area network management.

Exhibit IV-8 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-8

Importance vs. Satisfaction with IT Functions Performed In-house

Function	Importance	Satisfaction	Difference
New system development	4.4	3.4	1.0
Support of branch locations	3.8	3.2	0.6
Provision and support for wide area connectivity	3.8	3.3	0.5
Day-to-day support of the desktop environment	3.7	3.3	0.4
Day-to-day support of LANs	3.7	3.4	0.3
Application selection and integration	4.2	3.9	0.3
Maintenance of well-established applications	3.8	3.8	0.0
Day-to-day operation of datacentres	3.9	4.0	-0.1

Source: INPUT

This again confirms that the major issues within the banking and finance sector are new system development and the support of distributed IT infrastructures.

However, at present, many organisations remain to be convinced that the use of an external supplier is an appropriate solution to their problems in supporting distributed infrastructures. Exhibit IV-9 indicates the relative extent to which managers perceive it is necessary to perform each of the IT functions in-house.

Exhibit IV-9

Perceived Necessity of Performing Function In-house

In the banking and finance sector, many organisations would be prepared to outsource the management of their mainframe datacentres but are generally satisfied with their in-house management. On the other hand, they are comparatively dissatisfied with the management of their distributed architectures but frequently wish to retain this activity in-house.

C

Insurance — Restructuring Creates Major Applications Operations Opportunities

Exhibit IV-10 lists the principal business pressures on the European insurance sector, and Exhibit IV-11 identifies key areas for action in this sector.

Exhibit IV-10

Principal Business Pressures: Insurance

Exhibit IV-11

Key Actions: Insurance

Sample of 6 respondents. Standard error = 0.5

Source: INPUT

The insurance sector has a major need to improve customer service levels in common with the banking and finance sector. However, in other respects the major business pressures faced by the insurance sector are quite different from those faced by the banking and finance sector.

With the advent of direct selling and heavily automated competitors, much of the traditional insurance sector is experiencing considerable cost pressure and a need to introduce more competitive services and means of delivery. Overall, the insurance sector shows the highest level of need of any of the industry sectors to introduce new products and services and to reduce the lead times for their introduction.

This is likely to involve major restructuring of the industry and create major opportunities for both IT and business process outsourcing vendors.

The most important IT challenges facing organisations in the insurance sector are listed in Exhibit IV-12 and the least important challenges in Exhibit IV-13.

Exhibit IV-12

Most Important IT Challenges: Insurance

Sample of 6 respondents. Standard error 0.5

Source: INPUT

Exhibit IV-13

Least Important IT Challenges: Insurance

Sample of 6 respondents. Standard error = 0.5

Source: INPUT

Within the insurance sector, there is a continuing emphasis on interoperability. This includes linking legacy systems and providing greater flexibility through use of LANs. Most assurance products have lengthy lifetimes and so many insurance companies will be dependent on their legacy systems for many years. As a result, the insurance sector has been comparatively slow to move to more distributed IT architectures. It is probable that organisations in the insurance sector will typically retain their mainframes but will increasingly supplement their mainframe-based systems with more distributed applications.

The existing legacy applications will increasingly be subject to application maintenance management contracts as organisations endeavour to refocus their internal IT departments on improving the application of IT to the business and providing improved support for new business opportunities.

Exhibit IV-14 lists the most satisfactory attributes of IT departments belonging to organisations in the insurance sector and Exhibit IV-15 lists their least satisfactory attributes.

Exhibit IV-14

Areas of Highest Satisfaction: Insurance

Sample of 6 respondents. Standard error = 0.5

Source: INPUT

Exhibit IV-15

Areas of Lowest Satisfaction: Insurance

Sample of 6 respondents. Standard error = 0.5

Source: INPUT

Overall, the IT departments within insurance companies are perceived to be reasonably effective in applying IT to business problems but lack the strong knowledge of new technology found in the banking sector. In addition, IT departments are seen to focus excessively on operations support and take too long to develop and implement new applications.

This weakness in new system development, coupled with an inadequate understanding of new technologies, means that IT departments in insurance companies are particularly vulnerable to applications operations contracts. Many major insurance companies are candidates for major systems integration or application operations outsourcing contracts with vendors offering considerable business reengineering capability and knowledge of best practice in the insurance sector. Examples of organisations that have undertaken such contracts include INA with EDS, Marsh & McLennan with Andersen Consulting, and Gothaer Versicherungen AG with IBM Systeme und Netze.

Exhibit IV-16 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-16

Importance vs. Satisfaction with IT Functions Performed In-house

Function	Importance	Satisfaction	Difference
Application selection and integration	4.0	3.2	0.8
New system development	3.4	2.8	0.6
Provision and support for wide area connectivity	3.7	3.5	0.2
Day-to-day support of LANs	3.5	3.5	0.0
Day-to-day support of the desktop environment	3.3	3.3	0.0
Support of branch locations	2.8	3.2	-0.4
Maintenance of well-established applications	3.0	3.5	-0.5
Day-to-day operation of datacentres	3.2	3.8	-0.6

Source: INPUT

This again emphasises that the introduction of new systems is the major challenge facing the insurance sector. At the same time, the integration of new applications with existing systems is a cause of concern. On the other hand, the level of in-house support for legacy systems is perceived to be quite adequate.

Exhibit IV-17 indicates the relative extent to which managers perceive it to be necessary to perform each of the IT functions in-house.

Exhibit IV-17

Perceived Necessity of Performing Function In-house

Sample of 6 respondents. Standard error = 0.5

Source: INPUT

The insurance sector shows an unusual pattern here. The sector is probably unique in its desire to retain the management of datacentres and the maintenance of legacy applications in-house while, simultaneously, being prepared to extensively involve external vendors in the selection, development and integration of new applications.

Overall the insurance sector is currently an area of very high potential for outsourcing vendors. Major changes are occurring in the structure of the industry and organisations need to decide their response. In some cases, organisations will decide to withdraw from the life assurance market. However, even after the decision to stop selling policies has been

taken, there remains the existing portfolio which may need to be managed for up to 25 years. Many vendors will decide to outsource this now non-core activity, either as a business operations contract or as phase-out systems management contract. A number of vendors are beginning to target the former type of opportunity and Hoskyns has already been awarded a systems management contract of this type by Hill Samuel.

D

Discrete Manufacturing — IT Not Perceived as a Core In-house Activity

Exhibit IV-18 lists the principal business pressures on the European discrete manufacturing sector, and Exhibit IV-19 identifies key areas for action in this sector.

Exhibit IV-18

Principal Business Pressures: Discrete Manufacturing

Exhibit IV-19

Key Actions: Discrete Manufacturing

Sample of 23 respondents. Standard error = 0.3

Source: INPUT

Organisations in the discrete manufacturing sector currently place considerable emphasis on electronic commerce and improving their ability to work closely with both suppliers and customers. Information technology is perceived as a key enabler in facilitating the sharing of information with both customers and suppliers.

In addition, discrete manufacturing companies in Europe still face considerable cost pressure from foreign companies and strongly perceive the need to reduce their costs.

The most important IT challenges facing organisations in the discrete manufacturing sector are listed in Exhibit IV-20 and the least important challenges in Exhibit IV-21.

Exhibit IV-20

Most Important IT Challenges: Discrete Manufacturing

Sample of 23 respondents. Standard error = 0.3

Source: INPUT

Exhibit IV-21

Least Important IT Challenges: Discrete Manufacturing

Sample of 23 respondents. Standard error = 0.3

Source: INPUT

The discrete manufacturing sector is still endeavouring to move away from centralised architectures towards a more distributed approach. Much of the traditional outsourcing activity in the discrete manufacturing sector has been transition outsourcing, involving transferring the management of mainframe operations to an outsourcing vendor, while new, more distributed systems are being developed. These new systems were often designed to serve individual departments or business units and reflected the changing organisational structures, and levels of autonomy, within the companies concerned.

Organisations in the discrete manufacturing sector still exhibit a comparatively strong need to replace existing mainframe-based systems and to reduce their expenditure on IT.

Exhibit IV-22 lists the most satisfactory attributes of IT departments belonging to organisations in the discrete manufacturing sector and Exhibit IV-23 lists their least satisfactory attributes.

Exhibit IV-22

Areas of Highest Satisfaction: Discrete Manufacturing

Sample of 23 respondents. Standard error = 0.3

Source: INPUT

Exhibit IV-23

Areas of Lowest Satisfaction: Discrete Manufacturing

Sample of 23 respondents. Standard error = 0.3

Source: INPUT

Overall, the level of satisfaction with the performance of IT departments within the discrete manufacturing sector is very low. This is particularly true in terms of their ability to apply IT to the business, including areas such as their knowledge of business issues and the ability to apply this knowledge pro-actively. This may explain the recent switch in emphasis from the management of legacy systems to major applications operations contracts within the discrete manufacturing sector.

Exhibit IV-24 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-24

Importance vs. Satisfaction with IT Functions Performed In-house

	Importance	Satisfaction	Difference
New system development	4.0	2.8	1.2
Application selection and integration	4.0	3.0	1.0
Provision and support for wide area connectivity	3.7	2.8	0.9
Day-to-day support of the desktop environment	3.9	3.1	0.8
Day-to-day support of LANs	4.0	3.3	0.7
Support of branch locations	3.6	3.1	0.5
Maintenance of well-established applications	3.6	3.6	0.0
Day-to-day operation of datacentres	3.1	3.6	-0.5

Source: INPUT

In particular, satisfaction levels are low for all functions concerned with the identification, development and implementation of new systems and for support of distributed architectures.

As a result, a number of large manufacturing companies, for example British Aerospace, Lucas and FAG Kugelfischer have been the subject of major applications operations contracts in recent years, having decided that IT was not one of their in-house, strategic strengths.

Exhibit IV-25 indicates the relative extent to which managers perceive it to be necessary to perform each of the IT functions in-house.

Exhibit IV-25

Perceived Necessity of Performing Function In-house

Sample of 23 respondents. Standard error = 0.3

Source: INPUT

In the discrete manufacturing sector, there is no strong desire to retain any IT functions in-house. There is neither the desire to maintain a competence in legacy systems such as that found in the insurance sector nor a particularly strong desire to refocus the in-house IT department on new systems development.

The manufacturing sector has traditionally been one of the major areas of opportunity for outsourcing vendors and one of the first sectors in each country to adopt outsourcing. However, there still remains considerable potential for outsourcing in this sector. Indeed, there appears to be an increasing acceptance in the manufacturing sector that IT is not a core skill. As a result, there is a shift in emphasis from transition outsourcing and the management of datacentres to entrusting vendors with

responsibility for the re-application of IT to the business. This has already resulted in a number of contracts with major manufacturing organisations considerably in excess of \$100 million, and it is probable that this trend will continue over the next five years.

E

Process Manufacturing —External Assistance Required to Improve International Coverage

Exhibit IV-26 lists the principal business pressures on the European process manufacturing sector, and Exhibit IV-27 identifies key areas for action in this sector.

Exhibit IV-26

Principal Business Pressures: Process Manufacturing

Exhibit IV-27

Key Actions: Process Manufacturing

The principal priority for organisations in the process manufacturing sector is the need to develop an improved international coverage. Secondly, these organisations place an emphasis on improved interworking, and support, for their major customers. Maintaining relationships with their suppliers tends to be less important for process manufacturing companies than for discrete manufacturing companies. Accordingly, whereas much of the emphasis in electronic commerce is supplier-facing in the discrete manufacturing sector, it tends to be predominantly customer-facing in the process manufacturing sector.

The most important IT challenges facing organisations in the process manufacturing sector are listed in Exhibit IV-28 and the least important challenges in Exhibit IV-29.

Exhibit IV-28

Most Important IT Challenges: Process Manufacturing

Sample of 22 respondents. Standard error = 0.3

Source: INPUT

Exhibit IV-29

Least Important IT Challenges: Process Manufacturing

Sample of 22 respondents. Standard error = 0.3

Source: INPUT

Organisations in the process manufacturing sector exhibit a particularly strong need to cost-effectively increase their use of IT, a desire that has traditionally led to the process manufacturing sector having a comparatively high propensity for outsourcing. However, the overall emphasis within the sector is on aggressively applying IT to the business rather than reducing the level of IT spending.

Exhibit IV-30 lists the most satisfactory attributes of IT departments belonging to organisations in the process manufacturing sector and Exhibit IV-31 lists their least satisfactory attributes.

Exhibit IV-30

Areas of Highest Satisfaction: Process Manufacturing

Sample of 22 respondents. Standard error = 0.3

Source: INPUT

Exhibit IV-31

Areas of Lowest Satisfaction: Process Manufacturing

Sample of 22 respondents. Standard error = 0.3

Source: INPUT

The overall level of satisfaction with the performance of in-house IT departments is comparatively low in the process manufacturing sector, as in the discrete manufacturing sector. IT departments in the process manufacturing sector are typically perceived to be focused on systems provision rather than operations support but still exhibit weaknesses in applying IT to the business and in the rapid provision of new systems.

Exhibit IV-32 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-32

Importance vs. Satisfaction with IT Functions Performed In-house

Function	Importance	Satisfaction	Difference
Provision and support for wide area connectivity	3.9	2.8	1.1
New system development	3.9	3.1	0.8
Support of branch locations	4.1	3.3	0.8
Day-to-day support of LANs	3.6	3.0	0.6
Day-to-day support of the desktop environment	3.7	3.1	0.6
Application selection and integration	3.7	3.2	0.5
Day-to-day operation of datacentres	3.6	3.5	0.1
Maintenance of well-established applications	3.7	3.6	0.1

Source: INPUT

Organisations in the process manufacturing sector tend to have a broad geographic coverage both nationally and internationally. Accordingly, enterprises in this sector have been at the forefront in outsourcing the management of their distributed systems, both LANs and wide area networks. The need for support in these areas is illustrated in Exhibit IV-32.

In addition, the development of new systems remains a cause for concern.

Exhibit IV-33 indicates the relative extent to which managers perceive it is necessary to perform each of the IT functions in-house.

Exhibit IV-33

Perceived Necessity of Performing Function In-house

Sample of 22 respondents. Standard error = 0.3

Source: INPUT

Much of the traditional outsourcing in the process manufacturing sector has been related to downsizing and the replacement of mainframes and associated legacy applications. However, one of the principal characteristics of organisations in the process manufacturing sector is the distributed nature of the enterprise and the resulting high level of acceptance of client/server systems management encompassing both outsourced desktop services and wide area network management.

F

Retail — Strong Demand for Desktop Services

Exhibit IV-34 lists the principal business pressures on the European retail sector, and Exhibit IV-35 identifies key areas for action in this sector.

Exhibit IV-34

Principal Business Pressures: Retail

Exhibit IV-35

Key Actions: Retail

Organisations in the retail sector perceive themselves to be facing a high level of cost competition and much of their emphasis is on reducing their cost base. In this context, considerable emphasis is placed on improving their partnerships with major suppliers. In the retail sector, the emphasis on electronic commerce is focused strongly on their suppliers rather than their partners complementing the pattern seen for organisations in the process manufacturing sector that typically sell their products through retail outlets. However, at present, the geographic emphasis of retail organisations remains primarily national rather than international.

Encouragingly for outsourcing vendors, organisations in the retail sector exhibit a strong desire to increase their core business focus.

The most important IT challenges facing organisations in the retail sector are listed in Exhibit IV-36 and the least important challenges in Exhibit IV-37.

Exhibit IV-36

Most Important IT Challenges: Retail

Sample of 5 respondents. Standard error = 0.5

Source: INPUT

Exhibit IV-37

Least Important IT Challenges: Retail

Sample of 5 respondents. Standard error = 0.5

Source: INPUT

The priorities for IT in the retail sector are in improving its application to key areas of the business such as point-of-sale and sales analyses. As in the process manufacturing sector, the emphasis is firmly on cost-effectively increasing the application of IT to the business rather than reducing the absolute level of IT expenditure.

Exhibit IV-38 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-38

Importance vs. Satisfaction with IT Functions Performed In-house

Function	Importance	Satisfaction	Difference
Day-to-day support of the desktop environment	3.8	2.6	1.2
Support of branch locations	4.2	3.2	1.0
New system development	3.6	2.8	0.8
Provision and support for wide area connectivity	3.6	3.0	0.6
Application selection and integration	3.8	3.2	0.6
Day-to-day support of LANs	3.2	2.8	0.4
Day-to-day operation of datacentres	3.0	3.0	0.0
Maintenance of well-established applications	3.4	3.4	0.0

Source: INPUT

There is a significant need for improvement in the level of support for desktop/branch systems within retail outlets. However, support for the branch systems is currently perceived to be a key activity that should be provided by in-house personnel. This may be due to the unique nature of many organisations' in-store systems.

Similarly, the selection and implementation of new systems is typically not performed to a satisfactory standard in-house, but is perceived to be a critical activity that should be retained in-house. Exhibit IV-39 indicates the relative extent to which managers perceive it to be necessary to perform each of the IT functions in-house.

Exhibit IV-39

Perceived Necessity of Performing Function In-house

Sample of 5 respondents. Standard error = 0.5

Source: INPUT

In the retail sector in Europe, only organisations facing considerable competitive pressure have tended to adopt outsourcing. For example, GSI has successfully targeted the retail sector, including major supermarket chains, in France. In addition, EDS and CSC have signed major contracts with KF in Sweden and BhS in the U.K. respectively.

In the future, there is considerable potential for client/server systems management covering the widespread networks of major retailers. The sector also shows a comparatively high propensity for application maintenance management.

G

Wholesale — Opportunities Remain in Platform Operations

Exhibit IV-40 lists the principal business pressures on the European wholesale sector, and Exhibit IV-41 identifies key areas for action in this sector.

Exhibit IV-40

Principal Business Pressures: Wholesale

Sample of 4 respondents. Standard error = 0.5

Source: INPUT

Exhibit IV-41

Key Actions: Wholesale

Sample of 4 respondents. Standard error = 0.5

Source: INPUT

The wholesale distribution sector is facing considerable competition and perceives a very powerful need to reduce the cost of internal business processes. At the same time, organisations in the sector are endeavouring to strengthen their links with both customers and suppliers.

The most important IT challenges facing organisations in the wholesale sector are listed in Exhibit IV-42 and the least important challenges in Exhibit IV-43.

Exhibit IV-42

Most Important IT Challenges: Wholesale

Sample of 4 respondents. Standard error = 0.5

Source: INPUT

Exhibit IV-43

Least Important IT Challenges: Wholesale

Sample of 4 respondents. Standard error = 0.5

Source: INPUT

Overall, the wholesale sector shows considerable potential for outsourcing. The sector probably exhibits the highest cost pressure on the use of IT, with comparatively strong emphases on becoming more cost-effective in the use of IT and on reducing actual IT expenditure.

On the other hand, organisations within this sector show comparatively less enthusiasm for increasing the use of IT. This may mean that organisations in the wholesale sector are more prone to seek cost reduction from outsourcing vendors and will be less inclined to use outsourcing as a major means of redeveloping their use of IT.

Exhibit IV-44 lists the most satisfactory attributes of IT departments belonging to organisations in the wholesale sector and Exhibit IV-45 lists their least satisfactory attributes.

Exhibit IV-44

Areas of Highest Satisfaction: Wholesale

Sample of 4 respondents. Standard error = 0.5

Source: INPUT

Exhibit IV-45

Areas of Lowest Satisfaction: Wholesale

Sample of 4 respondents. Standard error = 0.5

Source: INPUT

IT departments within the wholesale sector are perceived to have a strong business orientation and understanding but, as elsewhere, to lack the ability to translate this understanding into innovative systems and to implement new systems rapidly and effectively.

Exhibit IV-46 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-46

Importance vs. Satisfaction with IT Functions Performed In-house

Function	Importance	Satisfaction	Difference
Day-to-day support of LANs	4.0	3.0	1.0
Day-to-day support of the desktop environment	4.5	3.5	1.0
Day-to-day operation of datacentres	3.8	3.3	0.5
Provision and support for wide area connectivity	3.3	2.8	0.5
New system development	3.8	3.3	0.5
Support of branch locations	3.3	2.8	0.5
Application selection and integration	3.0	2.8	0.2
Maintenance of well-established applications	3.3	3.8	-0.5

Source: INPUT

This suggests that the major opportunities within the wholesale sector will be related to IT infrastructure management. Overall, there are signs of a significant need for datacentre management in addition to desktop services and wide area network management.

Exhibit IV-47 indicates the relative extent to which managers perceive it is necessary to perform each of the IT functions in-house.

Exhibit IV-47

Perceived Necessity of Performing Function In-house

Sample of 88 respondents. Standard error = 0.1

Source: INPUT

H

Transportation —High Propensity to Outsource IT Functions

Exhibit IV-48 lists the principal business pressures on the European transportation sector, and Exhibit IV-49 identifies key areas for action in this sector.

Exhibit IV-48

Principal Business Pressures: Transportation

Sample of 11 respondents. Standard error = 0.4

Source: INPUT

Exhibit IV-49

Key Actions: Transportation

Organisations in the transportation sector want to improve their customer service capability on an international basis by increasing the flexibility of their business processes. Simultaneously, they perceive a need to reduce their internal costs.

The most important IT challenges facing organisations in the transportation sector are listed in Exhibit IV-50 and the least important challenges in Exhibit IV-51.

Exhibit IV-50

Most Important IT Challenges: Transportation

Sample of 11 respondents. Standard error = 0.4

Source: INPUT

Exhibit IV-51

Least Important IT Challenges: Transportation

Sample of 11 respondents. Standard error = 0.4

Source: INPUT

Organisations perceive the key to meeting their goals as improved and more outward-facing application of IT. However, this is not typically expected to be achieved by increasing the use of IT.

Exhibit IV-52 lists the most satisfactory attributes of IT departments belonging to organisations in the transportation sector and Exhibit IV-53 lists their least satisfactory attributes.

Exhibit IV-52

Areas of Highest Satisfaction: Transportation

Sample of 11 respondents. Standard error 0.4

Source: INPUT

Exhibit IV-53

Areas of Lowest Satisfaction: Transportation

Sample of 11 respondents. Standard error = 0.4

Source: INPUT

IT departments within the transportation sector receive comparatively high ratings relative to their counterparts in other sectors. Their major weaknesses are perceived to be the speed of introduction of new applications to the organisation and their ability to focus on the provision of new systems rather than operational support for existing systems.

Exhibit IV-54 compares the perceived importance of a number of IT functions with the current level of satisfaction with their performance in-house.

Exhibit IV-54

Importance vs. Satisfaction with IT Functions Performed In-house

Function	Importance	Satisfaction	Difference
New system development	4.0	3.0	1.0
Provision and support for wide area connectivity	4.4	3.5	0.9
Application selection and integration	3.9	3.1	0.8
Support of branch locations	4.0	3.3	0.7
Day-to-day support of LANs	3.8	3.3	0.5
Day-to-day support of the desktop environment	3.8	3.4	0.4
Maintenance of well-established applications	3.9	3.5	0.4
Day-to-day operation of datacentres	3.7	3.6	0.1

Source: INPUT

Despite the relatively high perception of the in-house IT departments' ability to apply IT to the business, there is typically a considerable shortfall between importance and satisfaction across a wide range of functions.

Exhibit IV-55 indicates the relative extent to which managers perceive it to be necessary to perform each of the IT functions in-house.

Exhibit IV-55

Perceived Necessity of Performing Function In-house

Sample of 11 respondents. Standard error = 0.4

Source: INPUT

Overall, organisations in the transportation sector exhibit a high propensity to outsource. In particular, they display a high level of willingness to outsource the selection, development and implementation of new applications.

Consequently, the transportation sector appears to offer major application operations opportunities. Because of its distributed nature, the transportation sector also offers strong opportunities in wide area network management and desktop services.

Country Markets

A

France — Strong Growth in Desktop Services

Exhibit V-1 provides a forecast of the outsourcing market in France by delivery mode.

Exhibit V-1

Outsourcing Market, France 1995-2000

	Market Forecast (FF millions)				
	1994	Growth 94-95 (%)	1995	Growth 1995-2000 (%)	2000
Platform Operations	1580	12	1770	10	2900
Desktop Services	520	35	700	29	2500
Network Management	840	10	920	17	2000
Applications Management	260	35	350	26	1100
Applications Operations	2600	18	3070	17	6850
Total IS Outsourcing	5800	17	6810	18	15400

Source: INPUT

Growth in desktop services is especially strong in France. Examples of recent desktop services contracts here include:

- Bull's contract with Elf to manage 4000 PCs across 50 LANs
- Euriware's contract with Institut Français du Pétrole
- Cap Sesa's contract with Scac Delmas Vieljeux.

Exhibit V-2 provides a forecast for the French outsourcing market by industry.

Exhibit V-2

Industry Sector Breakdown, France 1995-2000

	France FFm 1994	Growth 94-95 %	France FFm 1995	Growth 95-00 %	France FFm 2000

The government sector in France has so far yielded few opportunities for outsourcing vendors. However, the new French government may wish to follow some of the developments that have taken place in the U.K. In particular, they may begin to use external vendors towards the end of the forecast period to improve the cost-effectiveness of IT in central government.

As elsewhere in Europe, the major financial services institutions have been reluctant to enter into full-scale datacentre management and applications operations contracts with external vendors. However, a number of the French outsourcing vendors are predominantly owned by major financial institutions.

In particular, the financial services industry in France makes considerable use of processing services such as card-processing and electronic funds transfer from vendors such as Sligos and Axime, and there is potential for these types of service to develop into business operations contracts involving a wider range of billing and revenue collection activities.

Historically, there have been higher levels of activity in the distribution and transportation sectors in France than in the other major European countries.

Source: INPUT

The industry sector forecast for Germany includes an additional area: the SAP outsourcing activity there. While INPUT classifies much of the traditional SAP R/2 outsourcing activity as a processing service, SAP outsourcing is widely regarded as a form of outsourcing in Germany. Indeed SAP outsourcing is gradually changing from a mainframe-based processing service to a form of client/server systems management. The first contracts for SAP R/3 outsourcing began to appear in Germany towards the end of 1994. These contracts will increasingly be characterised by remote management of a distributed systems environment and have much in common with other client/server management contracts.

At present, most of the R/3 outsourcing contracts in Germany are arising out of organisations switching from non-SAP environments to R/3.

However, the market for SAP outsourcing will receive a significant boost once a significant number of organisations begin to make the transition from R/2 to R/3 in earnest.

The manufacturing sector has tended to dominate the outsourcing market in Germany and, as elsewhere, still has considerable growth potential. However, there will also be significant future growth in the financial services sector. IBM Systeme und Netze has already won a major contract with the insurance company Gothaer Versicherungen AG valued at approximately \$700m over 10 years.

It is still unclear whether or not the German government will adopt outsourcing to improve the efficiency and effectiveness of IT within government departments. Accordingly, the assumption made in the forecast shown above is that one major government department will outsource its IT by the year 2000.

The public sector continues to grow rapidly in the U.K.. However the pattern of growth in 1994 was different from that in 1993. In 1993, growth in the public sector outsourcing market in the U.K. was dominated by the local government sector, with vendors such as CFM and Capita Group showing very high levels of growth.

However, in 1994, the growth in outsourcing within the local government sector slowed down. This is probably a short-term phenomenon in response to a relaxing of the timetable for Compulsory Competitive Tendering (CCT). The new timetable will encourage renewed activity in local government outsourcing from 1996 onwards, with all authorities expected to have undergone CCT by early 1999.

However, this relaxation of growth in the local government sector has been more than compensated for by a high level of activity within central government departments. Following the outsourcing of the IT Office of the Inland Revenue, a number of other major government departments have now outsourced IT functions, including the Department of Trade & Industry, the Home Office, and, in 1995, the Department of Social Security.

The level of outsourcing in central government looks certain to remain high, at least during the lifetime of the present government. Indeed, the government has firmly placed the emphasis within the public sector on outsourcing contracts rather than systems integration projects with the launch of the Private Finance Initiative. The emphasis within this initiative is on substituting government-funded projects with the supply of ongoing services, where the supplier invests the initial capital and shares the commercial risk of the service with the public sector purchaser.

Any government department submitting a bid for funding for a major IT project to the Treasury is likely to be requested to redraft its proposals so as to invite tenders for ongoing services within the framework of the Private Finance Initiative.

This initiative will also have a major impact on the future procurement of services within the health sector.

The manufacturing sector continues to produce major applications operations contracts. Following its contract with British Aerospace, CSC recently won a major contract with Autoglass and seems certain to capture a major deal with Lucas industries, EDS having failed to agree terms with the company. In addition, the company has won a major downsizing contract with ICI Paints.

Much of the new activity in the desktop services and application management markets arises in the financial services sector. Traditionally, the financial services sector in the U.K. has been reluctant to undergo major platform operations and applications operations contracts, with the exception of a few downsizing exercises such as that at the Bank of England. However, it is now a time of considerable transition in the insurance sector in the U.K. and this is beginning to create new types of opportunity for outsourcing vendors.

Much of the redevelopment of systems in the U.K. utilities sector has already taken place. However, British Gas has recently announced a major contract to phase out a number of mainframe datacentres over a period of 18 months.

EDS strengthened its position in the outsourcing market in Italy in 1993 with the acquisition of the S&M Group. Having acquired local contacts, EDS was rewarded at the end of 1994 with a \$400m contract over 10 years with INA, the insurance company. The S&M Group focused largely on the financial services sector.

This deal may set an example that will be subsequently followed by Italian banks. In Italy, many of the banks still show a preference for taking a shareholding in their outsourcing vendor and limiting the outsourcing vendor's customer base within their sector. Nonetheless, vendors such as EDS and CSC are prepared to limit their involvement in a particular sector and region in return for a major applications operations contract. At the same time, vendors such as these can offer the client an injection of leading edge process and technology capability and the acquisition of their captive supplier.

It is likely that one of the leading vendors will succeed with this approach with one of the major Italian banking institutions.

However, it is also probable that there will be considerable growth in outsourcing within the Italian manufacturing sector. The manufacturing sector tends to be one of the early adopters of outsourcing in each country and is being strongly targeted in Italy by vendors such as IBM ISSC and EDS.

Sweden is characterised by an industry breakdown more similar to that found in the UK with a considerable emphasis on public sector outsourcing. In particular, there is a significant market in the local government sector, and the health sector is, at present, a better established opportunity in Sweden than in the U.K.

Again, the manufacturing sector represents a major opportunity now with the financial services sector slower to respond to the trend towards outsourcing. However, this sector remains a major source of opportunity over the next few years.

One of the characteristics of the Swedish outsourcing market is the relatively large size of the market in the distribution sector. In part, this is due to KF's considerable contract with EDS, but the market is not confined to this single contract.

Source: INPUT

In real terms, there is an increase of 2% between last year's IS outsourcing forecast for 1994 and this year's forecast. However, differences in exchange rates show an apparent 11% increase in the market, the net effect being an apparent increase of 13% in the size of the European IS outsourcing market.

The prospects for growth in the European IS outsourcing market remain strong and the growth rates forecast are similar to those forecast last year.

The principal adjustments that have been made to the 1994 forecast are:

- The size of the desktop services market in France has been increased to compensate for higher than expected growth in 1994 in this sector
- The overall size of the IS outsourcing markets in Spain and Finland have been increased following re-appraisals of 1994 vendor revenues in these countries.

Economic Assumptions

Exhibit E-1 lists the exchange rates used to prepare the forecasts in this report.

Exhibit E-1

US Dollar and ECU Exchange Rates: 1995

Country	Currency	US Dollar	ECU
Europe	\$	1	0.815
France	FF	5.34	6.54
Germany	DM	1.55	1.90
United Kingdom	PS	0.639	0.784
Italy	Lira (K)	1.62	1.99
Sweden	Sek	7.43	9.11
Denmark	DK	6.08	7.46
Norway	NK	6.76	8.29
Finland	FM	4.74	5.82
Netherlands	Dfl	1.74	2.13
Belgium	BF	31.8	39.00
Switzerland	SF	1.31	1.60
Austria	Sch	10.9	13.40
Spain	Ptas	131.6	161.40
Ireland	IP	0.647	0.794
Portugal	Esc	159.2	195.20
Greece	Dra	240.6	295.20
Eastern Europe	\$	1	0.815

Key Indicators

Exhibits F-1 - F-9 summarise some of the key indicators discussed in Chapter IV.

Exhibit F-1

Principal Business Pressures

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Improved customer service levels	Improved customer service levels	Improved partnerships with major suppliers	Improved international coverage	Competition for distribution channels	Improved partnerships with major suppliers	Improved international coverage
Interworking with major customers	Cost competition	Interworking with major customers	Improved support of international activities	Cost competition	Interworking with major customers	Cost competition
Improved international coverage	Need to introduce new services	Introduction of new models/services	Improved customer service levels	Improved partnerships with major suppliers	Improved customer service levels	Interworking with major customers
Improved support of international activities	Competition for distribution channels		Interworking with major customers	Improved customer service levels	Competition for distribution channels Cost competition	Improved customer service levels

Exhibit F-2

Key Actions

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Improve customer service	Improve customer service	Become more efficient	Become more efficient	Improve customer service	Improve customer service	Improve customer service
Increase core business focus	Increase speed of introduction of services	Increase flexibility of business processes	Improve customer service	Become more efficient	Become more efficient	Reduce cost of business processes
Become more efficient	Become more efficient	Reduce cost of business processes	Reduce cost of business processes	Increase core business focus	Reduce cost of business processes	Become more efficient
		Improve customer service		Improve effectiveness of business processes		Increase flexibility of business processes

Source: INPUT

Exhibit F-3

Most Important IT Challenges

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Applying IT to the business	Applying IT to the business	Applying IT to the business	More cost-effective use	Using IT for competitive advantage	More cost-effective use	Applying IT to the business
Using IT for competitive advantage	Adopting more distributed architecture	More cost-effective use	Applying IT to the business	Applying IT to the business	Applying IT to the business	Using IT for competitive advantage
More cost-effective use	Improving focus of IT department	Using IT for competitive advantage	Using IT for competitive advantage	More cost-effective use	Using IT for competitive advantage	More cost-effective use
More use of IT	Using more IT	Adopting more distributed architecture	More use of IT	More use of IT		Adopting more distributed architecture
International IT coordination	More cost-effective	Improving focus of IT department	Adopting more distributed architecture	Adopting more distributed architecture		

Source: INPUT

Exhibit F-4

Least Important IT Challenges

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Reduce IT expenditure	Replace mainframe-based systems	Improve support for operational systems	Reduce IT expenditure	International IT coordination	International IT coordination	Replace mainframe-based systems
Improve support for operational systems	Redevelopment of key systems	International IT coordination	Replace mainframe-based systems	Replace mainframe-based systems	Replace mainframe-based systems	Increase use of IT
Replace mainframe-based systems	International IT coordination	Change IT infrastructure	Improve support for operational systems	Reduce IT expenditure	Change IT infrastructure	Redevelopment of key systems
Change IT infrastructure	Change IT infrastructure	Replace mainframe-based systems	Change IT infrastructure	Improve support for operational systems		

Source: INPUT

Exhibit F-5

Areas of Highest Satisfaction

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Business orientation and understanding	Pro-active support for the business	None	None	Business orientation and understanding		Effectiveness in applying IT
Understanding of new technologies				Focus on systems provision		Business orientation and understanding
Pro-active support for the business						Pro-active support for the business

Source: INPUT

Exhibit F-6

Areas of Lowest Satisfaction

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale distribution	Transportation
System development timescales	Speed of application introduction	Effectiveness in applying IT	IT for competitive advantage		Speed of application introduction	System development timescales
Speed of application introduction	Focus on systems provision not operational support	System development timescales	Focus on systems provision not operational support		Ability to support bpr	Speed of application introduction
Geographic support coverage	System development timescales	IT for competitive advantage	Speed of application introduction		System development timescales	
	Understanding of new technologies	Overall cost-effectiveness	Effectiveness in applying IT		IT for competitive advantage	

Source: INPUT

Exhibit F-7

Largest Shortfalls: Importance vs Satisfaction

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
New system development	Application selection and integration	New system development	Wide area connectivity	Support of distributed environment	Support of distributed environment	New system development
Support of branch locations	New system development	Application selection and integration	New system development	Support of branch locations	Datacentre operation	Wide area connectivity
Support of distributed environment		Support of distributed environment	Support of branch locations	New system development	New system development	Application selection and integration
		Support of branch locations	Support of distributed environment Application selection and integration	Application selection and integration	Support of branch locations	Support of branch locations Support of distributed environment

Source: INPUT

Exhibit F-8

Least Desire to Perform In-house

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Datacentres	New system development	Operation of datacentres	Operation of datacentres	Operation of datacentres		Application selection and integration
Application maintenance	Application selection and integration	New system development	Application maintenance	Application maintenance		New system development
New system development	Support for wide area connectivity	Support for wide area connectivity				Operation of datacentres
		Application maintenance				Support for wide area connectivity and LANs

Source: INPUT

Exhibit F-9

Highest Desire to Perform In-house

Banking & Finance	Insurance	Discrete manufacturing	Process Manufacturing	Retail Distribution	Wholesale Distribution	Transportation
Support of branch locations	Application maintenance		Support of branch locations	New system development	WAN support	
Day-to-day desktop support	Operation of datacentres			Application selection and integration		
WAN support	Support of branch locations			Support of branch locations		

Source: INPUT
