October, 1995

Dear Colleague:

Enclosed is the 1995 industry forecast update for the education market sector, one of fifteen such markets or industries tracked by INPUT as part of its U.S. Market Analysis Program (MAP).

The report examines the information services needs of this marketplace, with special attention to the unique needs of the industry and technological and economic realities that are influencing the education sector. The trends, events and issues driving this market are identified and expenditures are forecast for each seven information services product/service categories.

Issues, trends and other factors affecting the education sector include the growing student population, the effects of budget restraints resulting from decreased tax revenues, the impacts of diversity and curriculum reform on the education sector issues, together with other research, is used to project the growth in the education market for information services over the next five years—through the year 2000.

Your purchase of this report includes access to our consultants who will be happy to answer any questions that you may have regarding this, or other INPUT reports which you receive.

You should file this report in your MAP Program binder, behind the tab marked Telecommunications.

Sincerely,

Robert L. Goodwin
Vice President

Introduction

A**Purpose**

The purpose of this forecast report is to identify key changes in the market for information services in the education sector, and to provide the 1995 INPUT forecast for this market sector.

Sector Definition—The education information services market includes SIC codes 821, 822 and 823 and is divided into three principal applications subsegments:

- Administrative applications
- Academic research/courseware applications
- Library applications

Administrative applications include education-specific administrative applications and networking of intra- and inter-campus IS resources.

Academic research/courseware applications contain software for curriculum instruction and computer literacy at all academic levels, including vocational/technical schools. It also includes teacher, professor or department-specific research projects.

Library applications comprise catalog maintenance and information retrieval, circulation control, loans and reservations, acquisitions, periodical control, indexing, and text search and retrieval. Also added are on-line library computer services, incorporating search and cataloging services.

B**Organization**

The balance of this report is organized as follows:

- Chapter II—*Trends, Events and Issues*—discusses the effects of educational reform, technology and budget concerns at all institutional levels. This chapter also looks at other issues, activities and changes that can have an impact on the current and future use of information services in the education marketplace.
- Chapter III—*Information Services Market*—presents an analysis of the expenditures for information services by product/service market and submarket for the U.S. education market sector. This chapter also includes an evaluation of the impact of the Internet on education and provides conclusions and recommendations regarding this market.
- Appendix A—which contains the *Forecast Database*—presents a detailed forecast of user expenditures, by information services product/service market and submarket sector, for the education vertical market. A reconciliation to the previous forecast is provided.

C

Methodology

Ongoing Research—Much of the data upon which this report is based was gathered during late 1994 and the first half of 1995 as part of INPUT's ongoing market analysis program. Trends, market sizes and growth rates are based on INPUT research and in-depth interviews with users in the education marketplace and the information services vendors serving that market. Interviewees for the research portion of this report were selected from this database of contacts.

Resources—INPUT's corporate library, located in Mountain View, California, provided extensive material for this report. The resources in this library include on-line periodical databases, subscriptions to a broad range of computer and general business periodicals, continually updated files on more than 3,000 information services vendors, and the most recent U.S. Department of Commerce publications on economic and industry statistics.

Forecast Estimates—Vendors, in response to interviews or questionnaires, may be unwilling to provide detailed revenue breakouts by product/service market segment or industry. Also, vendors often use different industrial categories and industry segments, or view their services as falling into different product/service market segments from those used by INPUT. Thus, INPUT must estimate revenue for these categories. For this reason, the product/service market forecasts and industry segment forecasts should be viewed as indicators of general patterns and trends rather than specific, detailed estimates for individual years.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that proper record-keeping is essential for transparency and accountability, particularly in the context of public administration and government operations. The text notes that such records are often used for auditing purposes and to ensure that funds are being used as intended.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It mentions the use of surveys, interviews, and focus groups to gather information from different stakeholders. The text also discusses the importance of using reliable and valid measurement instruments to ensure the quality of the data collected. Additionally, it highlights the need for careful planning and design of the data collection process to minimize bias and maximize the representativeness of the sample.

3. The third part of the document focuses on the analysis and interpretation of the collected data. It describes various statistical techniques and methods used to identify patterns, trends, and relationships within the data. The text emphasizes the importance of using appropriate statistical tests and measures to draw valid conclusions from the data. It also discusses the need to consider the context and limitations of the data when interpreting the results, as well as the potential for confounding factors and other biases that may affect the findings.

4. The final part of the document discusses the reporting and dissemination of the research findings. It emphasizes the importance of presenting the results in a clear, concise, and accessible manner that is understandable to the intended audience. The text also discusses the need to provide a thorough and transparent account of the research process, including the methods used, the data collected, and the analysis performed. Finally, it highlights the importance of sharing the findings with the relevant stakeholders and using the results to inform policy and practice.

D**Related Reports**

In addition to this market-specific report, the reader may also be interested in other INPUT reports, which address specific product/service markets and the U.S. and worldwide markets for information services. Such reports include the following INPUT publications:

- *U.S. Processing Services Market*
- *U.S. Systems Integration / Professional Services Market*
- *U.S. Network Services Market*
- *U.S. Applications Solutions Market*
- *U.S. Outsourcing Markets*

(Blank)

II

Trends, Events and Issues

A

Background

As noted in INPUT's 1994 report on education, this market is not so much a de facto industry as much as it is an institution. But it is an institution that is constantly under intense scrutiny, always judged on the basis of overall quality, content, equality and value.

In the United States, the right to an education is fundamental and guaranteed by law. Beyond this, the processes and methods of education are often hazily defined and therefore prey to various interpretation and controversy. The United States Constitution, for example, frames a government that is separate from the church. Yet in education, a government service, the teaching of the theories of evolution and creationism, and the suitability of school prayer (or moments of silence), are heatedly debated topics among religious groups, parents and educators.

The theological content of education is not the only ongoing controversy. Ethnic leaders, educators and parents continue to debate how the history taught in schools should be revised to more accurately relate the historical contributions of African, Asian and Native Americans to our nation. In English and literature classes, standard source materials, like Twain's *Huckleberry Finn* and Shakespeare's plays, have become controversial because of their apparent racial language and violent content.

However, within this context, the needs of students continue to drive both the philosophical and technological requirements of modern education. There are a number of trends, events and issues that will influence this market in 1995. Many of these will continue to shape the education sector through the end of the century. The balance of Chapter II discusses and analyzes these market influences.

THE HISTORY OF THE

The history of the world is a vast and complex subject, encompassing the lives and actions of countless individuals and the events that have shaped our planet. From the dawn of civilization to the present day, the human story is one of constant change and evolution. The study of history allows us to understand the patterns of human behavior, the causes of conflict, and the triumphs of the human spirit. It is a discipline that seeks to uncover the truth about the past, providing us with a deeper understanding of our place in the world and the challenges we face today. The history of the world is not just a collection of facts and dates, but a rich tapestry of human experience that continues to inspire and inform us.

B**Overview**

In contrast to most other industry sectors on which INPUT prepares information services market forecasts, the education market is relatively stable. There is a predictable flow of students (in essence, the market's "customers"). Most of the sector's financial reports and sources and expenditures of funds are accessible in public records. And its environment and activities tend to be highly structured and slow to change. As a result, the overall assessments of this marketplace contained in INPUT's 1993 and 1994 reports on the education sector are still valid. Significant changes that affect the information services market are noted in this forecast update and discussed in this and the following chapter.

C**Trends and Events**

1. Education Industry Growth

Fundamentally, education is a growth industry. This section examines the numbers that reflect that growth, emphasizing changes in enrollment, the teacher population and expenditures for education and academic libraries.

Enrollment—According to the Department of Education (DOE), the number of students enrolled in U.S. schools and colleges in late 1994 was about 64.5 million, an increase of less than 1% over the 63.9 million in 1993. This is expected to grow to 65.6 million by the end of 1995. Between 1995 and 2000, the total student population in U.S. schools is projected to grow to 69.8 million, an increase of 4.2 million or 6.4%. In grades K-12, the most significant growth will be in the public school system, which in 1995 will represent 88% of this segment. This will remain constant through 2000. Another agency, the National Center for Education Statistics (NCES), projects that public school enrollment will reach 32.3 million by the end of 1995, growing to 34.4 million by 2000. From the fall of 1994 to the fall of 2000, NCES forecasts a growth of 8% in public elementary school enrollment. The agency forecasts a 12% rise in public secondary school enrollment for the same period.

Enrollment in higher education, colleges and universities, rose to 14.7 million in 1994, a 0.7% increase over 1993. In 1995, enrollment are expected to narrowly miss 15 million. By 2000, college and university enrollments will reach roughly 15.5 million, a growth rate of 3.4%. Some economists expect the average annual cost for college tuition to decline, by as much as 4%, due to this projected increase in the higher education student pool.

Teacher Population—According to DOE figures for all education segments, the teaching population stood at nearly 3.8 million in 1994, an increase of 1.5% over 1993. This is expected to grow to roughly 3.9 million by the end of 1995, a further increase of 2.3%. By 2000, the number of teachers will rise 5.1%, from 3.9 million to approximately 4.1 million. The teaching population in public schools is still much larger than in private schools. In 1994, for example, 83% of all teachers worked in public schools. DOE projections show that this percentage will remain constant until 2000.

Although never the wealthiest of professions, the value of teachers' salaries rose roughly 13% between the 1983-1984 school year and the 1993-1994 school year. Although much of this increase occurred in the 1980s, the average teacher's salary in 1995 is expected to be about \$36,000 per year.

Expenditures—Expenditures for all education levels, kindergarten through postgraduate, reached \$484 billion in 1994, representing 7.6% of the U.S. GDP. Of this total amount, the K-12 segment spent nearly 60%, with the remainder spent by colleges and universities. The \$484 billion spent in 1994 represents a 4.6% increase over the \$463 billion spent in 1993. However, 1993 expenditures represented slightly more of the GDP, 7.7%. INPUT expects educational spending to remain at the 7.6% level, or decrease slightly, during the first 24 months of the forecast period. This is due to the flurry of budget-cutting activity in the federal government over the last year as the Clinton administration has fought with the House and Senate over ways to reduce the federal deficit. Public school programs for extracurricular activities, such as sports teams, have already been affected in states like California and Texas.

Academic Libraries—Expenditures for libraries fell from 3.3% of college budgets in the mid-1980s to about 3.0% in the early 1990s. Currently, they are stabilizing at about 3% and should remain at that level through the balance of this decade. Expenditures at the K-12 level are less, due to the narrower range of topics and research media (e.g., on-line computer systems).

2. External Trends and Events

As they have been for the last few years, the primary external trends affecting education programs and expenditures continue to be:

- Budget restraints resulting from decreased tax revenues and the slow pace of recovery after the recent economic slowdown
- Diversity in the student population, causing many and varying educational requirements

- A wide variance in school facilities, based on the level of local, district or county support
- Curriculum reform

Each of these trends is discussed in further detail below.

a. Budgets

Budgets for public schools, colleges and universities remain of primary concern. Funding for these institutions still comes primarily from taxes. However, the *26th Annual Phi Delta Kappa / Gallup Poll of the Public's Attitudes Towards the Public Schools*, published in late 1994, showed that many people remain unhappy with the way they are taxed to support schools. According to that poll, 53% of the public views current tax policies for funding education as unfair.

The poll noted that people are primarily unhappy with the inequalities in school funding because of the features most states have in their tax system. This often results in tax revolts, such as the one in Michigan in 1993 in which the local property tax was abandoned due to controversy over its ability to fund public schools. In most states, property taxes are the primary funding source for schools. However, protests from people with no children, or those whose children are not in public schools, is causing a shift away from property-based taxation in favor of sales tax increases to fairly distribute funding.

States are under increased pressure to produce funds for public schools, due largely to the current financial climate on Capitol Hill. Reducing the federal deficit is a top priority for Democrats and Republicans alike, particularly since the latter party gained majority control after the November 1994 elections. Nevertheless, President Clinton continues to struggle with both parties over the best way to cut government spending. One proposed strategy is to turn many federal responsibilities over to state governments. This would include more of the funding for public education, which would put more pressure on state and county governments to raise school taxes.

However, education is still a high priority for the Clinton administration. The President's Goals 2000: Educate America act was signed into law in March 1994. The act is designed to provide up to \$400 million per year to give education grants to states and school districts so they may adopt reforms consistent with the act's purpose of creating national education standards. This would form the heart of an overall public education framework to increase academic excellence by more strongly connecting curriculum, instruction, assessment and standards. Title III of Goals 2000 provides funds for each state's efforts to improve its own academic

standards, with the proviso that more funding will be available based on the assessed improvements in education, notably student achievement and instruction quality.

Another component of Goals 2000, Title II, has unfortunately been virtually shut down. Title II created the National Educational Standards and Improvement Council (NESIC), a federally funded body whose purpose is to establish national content and performance standards in academic subjects and evaluate those devised by state governments. The NESIC is designed to lead by example, giving states the primary creative responsibility for improving public education. Although this Goals 2000 component was supported by many Republicans in 1994, the majority they achieved after the November elections expressed little interest in funding an agency for national education standards. Many analysts and government officials view the NESIC as a dead entity.

Overall, progress has been slow for Goals 2000, yet the act is having a positive impact. INPUT believes that Goals 2000, particularly the Title III component, is a key means of coordinating standards and funding to improve education through the end of the decade.

b. Diversity

Diversity takes many forms in the educational environment. It includes participants with different learning capabilities, language skills, economic backgrounds and ethnic origins, and an increasing number of physically handicapped individuals. Virtually all educational systems now recognize diversity as a normal component of the educational process, and most teachers are skilled in dealing with it in the classroom.

The personal computer has proven to be a superb tool for coping with a heterogeneous group of students with varying educational needs. With a PC and any of the numerous sophisticated education software packages available, a teacher can tailor instruction to the level appropriate for a given student. This establishes instructional consistency in the classroom, without overburdening a teacher who may well be overtaxed already.

So, although diversity is a challenge, hardware and software technologies are helping to remove it as a major educational stumbling block. The unfortunate reality of budget constraints remains, however, so many school systems must rely on older technology or solicit donations due to the cost of PC systems.

c. Variations in School Facilities

There are unfortunate inequities throughout the U.S. public education system, and they are nowhere more apparent than in the wide variety of facilities schools use on a daily basis. For example, a middle school in a working-class section of the Bronx is less likely to have the kind of equipment and materials available to a comparable school in Beverly Hills. This is particularly true when the equipment in question is computers and related software and hardware. Yet one fundamental problem most public schools, colleges and universities share is the daunting expense of wiring existing classrooms with the electricity and telecommunications lines necessary for each student to have a computer.

The less costly alternative to bringing computers to the students is to bring the students to the computers. More and more public schools are doing this by creating and equipping special computer rooms, commonly called learning centers or computer laboratories, where students can go during school to use computers loaded with the courseware appropriate to their work needs. In fact, many educators, particularly in primary and secondary schools, prefer this method because they often see computers as a distraction from traditional teaching methods. In more advanced school computing environments, students are able to turn in homework to the teacher electronically using learning center PCs on a local-area network (LAN)-based, client/server system.

LANs are not the only means of connecting school computers. The use of on-line network access is gaining credibility as a means for one school or an entire district to educate and administrate over the Internet. In Naples, Florida, for example, students and teachers use the Florida Information Resource Network (FIRN) to conduct interactive educational exercises with students in other Florida schools and in other countries. FIRN users have free access to electronic mail, which allows students and teachers to interact on such things as professional development and student projects. Students can also work on projects with counterparts in other countries, such as England, that use similar systems.

Colleges and universities tend to be much better equipped, technologically speaking, because of the typical demands of their curricula. For schools at all levels, however, the power and telephone lines we take for granted in business are absolute essentials. Without these resources, the value of the computer in the school or classroom is greatly diminished.

d. Curriculum Reform

According to the Phi Delta Kappa/Gallup poll referenced previously, the U.S. public does not feel that schools emphasize the so-called three Rs of reading,

10. Contact Information

writing and arithmetic, along with science and history. Yet the poll indicates that the public also wants a broader curriculum, one that places high emphasis on foreign language, music and art. Computer training and business education are also subjects that parents want their kids to learn.

An argument that has been added to curriculum discussions is whether subjects should be taught from a monoculturalistic or a multiculturalistic point of view. Some parents and religious groups have protested the "tendency to abandon the melting-pot metaphor in favor of 'tossed salad'," according to one educator. This "tossed salad" approach is controversial because it emphasizes each ethnic group's cultural traditions rather than the common traditions Americans share. According to the Kappan/Gallup poll, 75% of the public favors the promotion of both common and diverse traditions, yet this aspect of curriculum reform remains a heated topic.

3. Information Services Trends in Education

Information services activities in education tend to fall into three broad categories—academic courseware, administrative applications (for K-12 and higher education) and expanded on-line and CD ROM services for academic libraries. Each area is briefly considered in the following paragraphs, and is consistent with INPUT's prior analyses.

a. Academic Courseware

There has been steady progress in the acceptance and quality of computer-aided instruction (CAI) in K-12, where many now regard computer literacy as a fundamental skill. In fact, the U.S. Department of Education estimated that by the fall of 1993, 68.9% of all U.S. K-8 students used microcomputers. The figure for grades 9-12 was over 10% lower, at 58.2%. Higher education has been slower to embrace commercial courseware (due to an ingrained belief that university instruction is somehow unique), but there too, acceptance of CAI is growing. Between 1989 and 1993, student use of computers in the first through fourth year of college rose from 39.2% to 55.2%. The future for such courseware, however, is generally believed to lie with client/server systems (e.g., IIS or ILS), and for most schools, client/server and the microcomputer (PC, Macintosh) will be the vehicles for implementation. Multimedia will also offer the opportunity for integrating educational modules to stimulate all the senses and improve and enhance the learning process.

b. Administrative Applications

Although academia is not generally regarded as a business environment, the fact is that the education process must run with balanced budgets and

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is crucial for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent and reliable data collection processes to support effective decision-making.

3. The third part of the document focuses on the role of technology in data management and analysis. It discusses how modern software solutions can streamline data collection, storage, and reporting, thereby improving efficiency and accuracy.

4. The fourth part of the document addresses the challenges associated with data management, such as data quality, security, and privacy. It provides strategies to mitigate these risks and ensure that data is used responsibly and ethically.

5. The fifth part of the document discusses the importance of data governance and the role of leadership in establishing a strong data culture. It emphasizes that clear policies and standards are essential for successful data management.

6. The sixth part of the document provides a summary of the key findings and recommendations. It reiterates the importance of a data-driven approach and offers practical advice for implementing effective data management practices.

7. The final part of the document includes a conclusion and a call to action, encouraging all stakeholders to take ownership of their data and work together to achieve the organization's goals through data-informed decision-making.

proper accounting for resources and student achievement. There is an expanding family of K-12 administrative applications designed to improve the management and accounting processes and automate record keeping. Such applications often incorporate Information At Your Fingertips (IAYF) technology, and most of them are microcomputer based. In higher education, the major activity is the expansion of local (campus) and national networks to permit effective resource sharing and improved instructor productivity. Most institutions are also exploring the benefits of multimedia instruction. The primary concern is cost, and such systems tend to be as effective as their weakest component.

c. Academic Libraries

Technical areas of primary interest to academic libraries are CD ROM, on-line services, E-mail and imaging. On-line services are proliferating, with most university campuses offering remote access to many library facilities. The World Wide Web has become a burgeoning source of multimedia on-line access to college and university resources. Imaging offers exciting opportunities for document storage and retrieval. Costs for such systems, even at the lower end, are still high, but are gradually becoming more affordable.

D

Commentary

As will be noted in the following chapter, *Information Services Market*, the K-12 courseware market is the second largest in the education sector. Many educators believe that the content of this market provides the information technology versions of the experiences that form the basis of learning skills and future intellectual development. As noted previously in this chapter, people are strongly in favor not only of the "three Rs," but in broader-based education that includes computer-based training, which they view as crucial for the "wired" age that has emerged and continues to spread.

Computer literacy is already considered a basic, necessary skill in numerous school districts. In many colleges and universities, it has become virtually impossible to do homework or projects without a computer. The days of slide rules, typewriters and even calculators are all but gone.

Even though its ability to spend real dollars is small, American industry recognizes the value of the K-12 market. For years, suppliers such as Apple—and more recently IBM and Compaq—have been underwriting education with the belief that students who grow up learning on a particular system will be committed to that brand through college and into professional life.

The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry, no matter how small, should be recorded to ensure the integrity of the financial statements. The text also highlights the need for regular audits and reconciliations to identify any discrepancies early on.

In the second section, the author provides a detailed overview of the accounting cycle. This process involves ten distinct steps, from identifying the accounting entity to preparing financial statements. Each step is explained in detail, with examples provided to illustrate how they are applied in a real-world business context.

The third section focuses on the classification of assets and liabilities. It explains how to distinguish between current and long-term assets, as well as current and long-term liabilities. This classification is crucial for determining the company's financial health and its ability to meet its obligations.

The final part of the document discusses the preparation of the balance sheet and the income statement. It provides a step-by-step guide on how to calculate net income and how to present the information in a clear and concise manner. The author also includes a checklist of common errors to avoid when preparing these financial statements.

However, funding limits are still a major barrier to growth. Even when subsidized, the costs of IS solutions, in terms of K-12 budgets, are high. Regardless, INPUT believes that the investment will be made. Anything else is unthinkable and highly impractical, as the result would be a labor force that lacks critical technological skills and would be less competitive in a world market in which countries like Germany and Japan already educate their children more effectively than does the U.S.

(BLANK)

Information Services Market

This chapter discusses the expenditures for information services in the education marketplace. User expenditure forecasts are provided for the education industry by industry sector and product/service market sectors. Assumptions driving the forecasts are presented. Note that these forecasts do not include functional, general-purpose information services such as those used for human resources, accounting, or generic planning and analysis. The markets for these types of information services are presented in the *Information Services Cross-Industry Markets* report, rather than in the industry-specific reports.

Note that the numbers used in the exhibits are rounded. Precise values are used in the text and Appendix A, the *Forecast Database*.

Section A, Overview, notes the overall size and growth rate of the education market's expenditures for information services.

Section B, Product/Service Market Sector Analysis, segments the data into INPUT's seven standard product/service market categories.

Section C, Industry Segment Analysis, restructures the forecast in terms of the major market segments within the education industry. These segments are:

- K-12 Administrative Systems
- K-12 Courseware
- Higher Education Administrative Systems
- Higher Education Courseware
- Academic Libraries

Section D, The Internet in Education, offers an assessment of the impact of the resource on the education market.

[The page contains extremely faint and illegible text, likely bleed-through from the reverse side of the document. No specific content can be transcribed.]

Section E, Conclusions and Recommendations, provides INPUT's analysis and recommendations for this industry.

A

Overview

The academic education information services market includes software and services for K-12, colleges (including two-year vocational/technical schools), universities and academic libraries. There are also separate administrative and curriculum courseware markets.

The information services requirements are unique for each of the segments. As a result, most of the companies that provide information services to the academic education markets specifically address one of the three market subsectors—K-12, higher education, or libraries. In addition, companies that produce academic courseware or administrative software usually represent two different vendor types.

In 1995, the academic education market will be just over \$2.6 billion. This market is expected to increase at a compound annual growth rate (CAGR) of 14%, from over \$2.6 billion in 1995 to just under \$5 billion in 2000, as shown in Exhibit III-1.

Exhibit III-1

Education Sector—Information Services Market, 1995-2000

Note: Values have been rounded.

Source: INPUT

Although the current five-year growth rate projection for the education market sector has increased from the 12% CAGR forecast in the 1994 report, two factors will continue to have an effect on the education sector—enrollment and budgets.

Enrollment

- The enrollment projected for elementary schools in prior years has now been adjusted by the National Center for Educational Statistics to reflect an 8% growth rate through the year 2000, while secondary school enrollment will increase by 12%. Because elementary schools provide the raw material for secondary schools, colleges and universities, enrollment at the senior institutions is now also projected to increase.

More school-age children are attending elementary schools and continuing on to secondary levels. Despite decreases in the traditional college-age population, college and university enrollment reached 14.7 million in 1994, up from 14.6 million in 1993. In 1995, total college and university enrollment is expected to reach 14.9 million and grow to 15.5 million by 2000.

Budget

- There is continuing budget sensitivity in all the academic education markets. This sensitivity is a considered response to changing patterns in student enrollments, expected cutbacks in federal grants for education, and reductions in the corporate tax base in many inner-city and rural environments.

Stated another way, the budgetary concerns are a logical response to the recent prolonged economic slowdown. The ability of taxpayers to vote for (or against) increases in school funding will serve as a driving force for public schools' annual budget growth.

The Clinton administration's enactment of the Goals 2000 program, though inherited from George Bush, has given the President a clear agenda and methodology by which to improve American public education. In spite of looming budget cuts as deficit-reduction negotiations continue, Goals 2000 appears to be headed for success, which may ease the budget anxieties noted previously. Goals 2000 has a grassroots focus, a crucial factor since local educators, with input from parents and students, are being encouraged to think in creative, forward-thinking ways. This is critical to U.S. students, who will become the business and government leaders of the next millennium.

B

Product/Service Market Sector Analysis

Forecasts by product/service market sector for user expenditures in the education sector are shown in Exhibit III-2. INPUT analyzes the vertical information services markets by seven such sectors, and the following sections discuss the growth projections for each of them.

Exhibit III-2

Education—Information Services Market by
Product/Service Market Sector, 1995-2000

Note: Values have been rounded.

Source: INPUT

1. Processing Services

INPUT defines processing services for the educational market as transaction processing services. This can involve third-party processing of administrative applications, use of remote supercomputer facilities for research applications, and test scoring and statistical analysis by service bureau-type operations.

Expenditures for processing services in the education information services market will continue to grow at a 2% annual rate, increasing from more than \$220 million in 1995 to more than \$240 million in 2000. Processing services growth in this market is flat due to the increasing use of personal computers and LANs for accounting and other administrative tasks that can now be done in-house. Local school district service bureau consortiums, which provide district-wide administrative applications, are not included in the processing services information services market figures because they are considered to serve a captive market.

2. Turnkey Systems

Turnkey systems applications integrate systems software, packaged or customized applications software, a CPU and related equipment and peripherals. User expenditures for turnkey systems will continue to show the second slowest growth rate, 8%, in the educational information services market over the next five years. From just over \$290 million in 1995, the turnkey systems education market is expected to increase to just over \$420 million in 2000.

The CD ROM market offers an exciting growth opportunity for turnkey systems vendors, particularly in the library environment. The popularity and effectiveness of the CD ROM as a training and applications tool is demonstrated by its growing use with business and home computers.

Turnkey systems also represents a substantial share of the K-12 administrative systems market, particularly because a school or an entire district will often seek a contractor to provide systems that school personnel need. Unbundling of hardware and software and related services should also be considered a competitive opportunity. A significant part of the market also includes test scoring systems delivered as a turnkey systems solution.

3. Applications Software Products

The academic educational market for applications software products is the largest market segment in the education industry and includes courseware, administrative and library software at the K-12 and higher education levels. The educational applications software markets are expected to increase from roughly \$1 billion in 1995 to nearly \$2 billion in 2000, at a CAGR of 13%.

The academic educational software industry consists of a large number of companies, including independent academic courseware developers who specialize primarily in the K-12 markets, textbook suppliers and computer

1. The first part of the document discusses the importance of maintaining accurate records of all transactions.

2. It is essential to ensure that all entries are supported by appropriate documentation and receipts.

3. Regular audits should be conducted to verify the accuracy of the records and identify any discrepancies.

4. The second part of the document outlines the procedures for handling disputes and resolving conflicts.

5. It is important to establish clear communication channels and protocols for addressing any issues that arise.

6. The third part of the document provides a detailed overview of the financial statements and reports.

7. These reports should be prepared on a regular basis and presented to the relevant stakeholders.

8. The fourth part of the document discusses the role of the management team in overseeing the organization's operations.

9. It is crucial for management to stay informed about the company's performance and make strategic decisions.

10. The fifth part of the document concludes with a summary of the key findings and recommendations.

11. It is hoped that this document will provide valuable insights and guidance for the organization's future success.

12. The sixth part of the document provides a detailed overview of the financial statements and reports.

13. These reports should be prepared on a regular basis and presented to the relevant stakeholders.

14. The seventh part of the document discusses the role of the management team in overseeing the organization's operations.

15. It is crucial for management to stay informed about the company's performance and make strategic decisions.

16. The eighth part of the document concludes with a summary of the key findings and recommendations.

17. It is hoped that this document will provide valuable insights and guidance for the organization's future success.

systems companies. Although there is great interest among users and vendors in increasing the amount of computer-assisted instruction in K-12 classrooms, a number of factors are negatively impacting faster growth in this market. They are a continuing concern in this market.

- Ongoing K-12 budget constraints for hardware and software. These result in smaller profit margins for vendors, making the more profitable commercial (business) market more attractive.
- The need to upgrade classroom computer hardware from older equipment to new, more reliable and user-friendly devices
- The need for more intensive teacher training (staff development) in computer literacy, use and teaching techniques

Client/server or LAN-based applications offer an opportunity to blend traditional and computer-aided instruction smoothly in a structured environment. This centralized approach offers efficient equipment use and provides a supportive environment for teachers with limited computer skills.

Many educators consider the greatest opportunities for software products to be in multimedia. Multimedia is already in use in many schools in the form of tools used for supplemental curriculum, reference and presentation development. Growth will continue in these core areas and expand to a broader range of courseware. The driving force will be the enthusiasm of those teachers who have already used multimedia and report that the experience generates greater enthusiasm for learning, stimulates superior levels of research and data gathering skills and results in improved student synthesis of information and depth of analysis.

At this time, the commercial courseware market for higher education will continue to remain relatively small due to the complexity of the courseware required and the expense of developing such programs. However, its growth rate is increasing. One reason for the improved growth is the greater use of standard applications software packages in many core undergraduate courses. For example, an English department might decide upon a standard word processing program, such as Word for Windows or WordPerfect. Another factor driving the higher growth rate is the low base from which the growth started. Growth began in the early 1980s, when desktop technology was used on a piecemeal, person-by-person basis in a given university or college department.

4. Outsourcing

Outsourcing involves the use of an outside vendor to perform part of an institution's computer operations. It can require that the vendor operate all

the data processing facilities—which can be done either on site or off site—and/or perform application development and business integration along with telecommunications management services.

Outsourcing has become a fast-growing market in many industries, and the education sector is no exception. As shown in Exhibit III-2, in 1995, the education sector's outsourcing expenditures will be almost \$430 million, and are expected to reach \$980 million in 2000, with a CAGR of 18%. This growth rate ties outsourcing with network services as the fastest growing product/service sector in the education market.

As the complexity of computer applications expands in the K-12 and higher education markets, the need for sophisticated platform operations management and distributed/integrated applications development has been a stimulus to third-party outsourcing growth.

5. Systems Integration

The 1995 educational market for systems integration will total \$165 million. It is expected to grow at a CAGR of 16% over the next five years and reach over \$340 million in 2000. (See Exhibit III-2.)

One reason for the high growth expectation for systems integration in the educational markets is the continuing need for providing intra- as well as inter-campus networking capabilities—tasks requiring the integration of new and existing technologies, including their respective applications and operating systems. At the K-12 level, there is also a growing need to interconnect local schools with district headquarters, even though network services is a better choice for this type of requirement.

In higher education, the use of outside systems integrators is limited. Contributing factors include the perceived high cost of long-term contracts, a desire to maintain integration control, and a slow movement toward distributed applications. This last factor is becoming less and less important as colleges and universities implement electronic classroom (ECR) and virtual teaching technologies.

6. Professional Services

The professional services product/service market sector is defined as a management consulting activity related to information systems, development of custom software and education and training. In 1995, the educational market for professional services will be almost \$120 million. It will grow at a CAGR of 14%, reaching over \$220 million in 2000.

The educational professional services market consists primarily of services provided at the higher education level in association with sales of administrative software and custom software development. In particular, as software solutions become more complex, there is an increasing need for consulting, education and training support services. In addition, the ability to customize standard solutions is increasing the acceptance of third-party-developed administrative software solutions in the higher education market. The demand for combining software and support services in the higher education market is expected to result in parallel growth in the professional services and the standalone applications software markets.

7. Network Services

INPUT defines the network information services market as consisting principally of electronic information services (EIS) and network applications, such as E-mail. Electronic information services are defined as database, news and video text services.

The educational market for network/electronic services is projected to grow at an 18% annual rate, from nearly \$350 million in 1995 to over \$780 million in 2000, with an expected strong demand for on-line database delivery and E-mail facilities.

The education market, particularly in colleges and universities, is relying more and more on network services to meet a variety of needs. Most major post-secondary institutions have E-mail networks through which students can access the Internet. Academics use on-line news and database services to do research and to confer with colleagues in other states and countries. Campuses with highly developed networks, such as the University of Illinois at Urbana-Champaign, are wired to allow students in dormitories to turn in homework, take exams and contact professors using a PC, some custom software, and local- or wide-area network access.

To date, however, E-mail remains the most common application requiring network services on campuses. Last year, INPUT reported that much of this activity is based on mainframe/terminal communications. This has changed as the price of a basic, modem-equipped PC has come down in the last year.

C

Industry Segment Analysis

The size of the education market for 1995, by principal application segment, is shown in Exhibit III-3.

Exhibit III-3

Education Market by Segment—1995

Note: Values have been rounded.

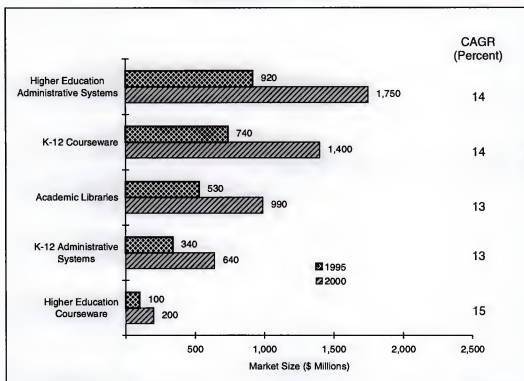

Source: INPUT

The 1995 and 2000 information services market sizes and five-year growth rates for the segments of the education industry market are provided in Exhibit III-4.

Exhibit III-4

Education Sector Information Services Market by Segment, 1995-2000

Note: Values have been rounded.

Source: INPUT

- The courseware sectors will experience slightly faster growth in higher education (15%) than in K-12 (14%). This condition is driven by the growing acceptance and availability of commercial software for the higher education segment, and by the small base from which the growth started.
- Administrative systems expenditures at the higher education level are the largest market segment and are growing faster due to the greater availability of funds. In addition, there is a strong need to improve business efficiency and budget performance at the college and university level.
- The use of network services (on-line databases), E-mail and on-line interactivity, and the need to build inter-library networks fuel the academic library segment's growth. As use of the Internet grows, it will act as a growth stimulator for academic libraries as more information sources go on-line.

LECTURE 1

THE PHILOSOPHY OF

SCIENCE

1. INTRODUCTION

D**The Internet in Education**

In his short story *The Fun They Had*, the late author Isaac Asimov presented a snapshot of a possible future in which two children marvel over a printed book and wonder about the fun their ancestors must have had reading its pages in a physical classroom. You see, the children in this future are educated exclusively by computers located in rooms in their own homes, right next to their bedrooms.

Will the Internet be a catalyst for change in this direction? INPUT believes that this is still unclear. Educators, legislators, students and parents continue to argue about, and evaluate, the role of computer technology in education. In a sense, the use of technology in education is extremely unbalanced. Internet access is as easy and cheap as a local phone call and a CompuServe account, yet the tools that primary and secondary school students need—computers with modems—are in short supply in the vast majority of U.S. public schools. Most school children are unable to use Internet resources until they get to college, unless they or their friends have computers at home. In Washington, D.C., for example, most students must physically go to the Smithsonian or the Library of Congress, for they have no access to the Web pages these institutions offer.

The Internet's value as an educational resource rests upon three issues. First, with the exceptions noted earlier in this report, most public schools do not currently have the resources to give students Internet access. Second, education is not the high priority it should be in the commercial scramble to establish a profitable on-line presence. Third, giving teenagers and pre-teenagers Internet access has created an exaggerated, but real, concern about protecting children from adult or sexually explicit materials and communications. Until these three issues are resolved, the Internet's role in education will remain problematic.

E**Conclusions and Recommendations**

1. Conclusions

Although the state of U.S. education is not exactly grim, there is vast room for improvement. Public schools in particular still face the problems of budget cuts, political agendas and philosophical controversy. The first problem most affects how much, and what kind of, technology is available to most students.

But students are not the only concern. Many educators understand how the personal computer and educational software can improve the efficiency and the content of teaching, but the traditional methods most teachers still use have proven difficult, and time-consuming, to adapt to technology use.

The Goals 2000 program is perhaps the best legislative means of addressing these and other fundamental problems in education. Goals 2000 presents a clearly defined set of plans for the effective implementation and use of computer technology in education. However, the government must prove it can improve its spotty record on education.

2. Recommendations

The private sector has the most to gain from better educated students. A well-educated student pool is perhaps the best resource this country could have to enhance global competitiveness and technological innovation.

Vendors who understand this and focus their marketing and product development on achieving this goal will be the vendors who succeed in the education market. In a sense, this continues to be a "labor of love," as opportunities in the education market can prove elusive, due largely to budget constraints, and relationships must be nurtured once they are established. The rewards for patience can prove to be great, furthering vendor success and innovation, and education in general.

Forecast Database

This appendix contains the forecast database for the period 1995-2000 and the 1995 MAP database reconciliation.

There were some notable differences between the 1994 projection for the 1994 market and the actual expenditures reported in the 1995 forecast. The maximum variance was \$35 million in the total education market, or a 2% understatement of the total market in 1994. The variance is due to significant shifts in the professional services and outsourcing markets.

Professional services spending in 1994 was 9% below expectation, as the requirements for technical, planning and implementation support grew less rapidly than anticipated. A factor in this variance is the delay resulting from conservative fiscal policies enacted during the prolonged economic downturn.

outsourcing spending in order to control information systems costs and still provide the capacity and functions needed to support both academic and administrative needs.

Variances in the projections for product/service markets for 1999 range from \$133 million for applications software to \$5 million for processing services. In terms of percentage variance, all values rounded to a \$289 million (7%) understatement of 1999 performance in the 1994 report. This overall variance is driven by a 14% variance in INPUT's forecast of the outsourcing market and an 8% difference in the applications software forecast. Applications software in particular will grow at 13% annually, remaining the largest market due to anticipated demand as computer-based instruction becomes more prevalent.

The only significant variance in the CAGRs reported in 1994 and 1995 is for professional services, which is forecast to grow 15% annually, versus the 10% reported in 1994. This is due to this market segment's \$19 million forecast difference from the 1994 report. This, combined with the small size of the market, accounts for the CAGR difference.
