I INTRODUCTION

I INTRODUCTION

A. PURPOSE AND SCOPE

- The primary objectives of this study of the market for user site hardware services (USHS) from remote computing services companies were to:

  - Determine the market for information processors at customer sites from RCS companies.

  - Estimate market penetration based on alternative marketing strategies, including the approaches of ADP Network Services, Inc., National CSS, Inc., and GEIS Company.

  - Analyze the sales and buying processes for the products.

  - Make recommendations for both market entry and expansion.

- Following on the earlier work presented in INPUT's report, "Opportunities in User Site Hardware Services," INPUT conducted an in-depth analysis among vendors, EDP managers, financial executives, and end users concerning attitudes toward, and plans for, RCS vendor-supplied user site hardware services.

- Each client was contacted for their special concerns.

- 1 -

INPUT

- Issues that are client specific are addressed here in Volume I.

- Concerns common to all participating clients are included in the general research reported in Volume II.

B. RESEARCH AND METHODOLOGY

- The research conducted in this report primarily addresses RCS vendor offerings termed user site hardware services (USHS) which:

    - Place intelligent hardware (i.e., terminals, microcomputers, mini-computers) at the user's site, or at the vendor's site dedicated to the user's use.

    - Offer user access to the RCS vendor's communications network.

    - Offer user access, through the vendor's RCS networks, to the RCS vendor's mainframes or to other RCS vendor intelligent hardware supplied to the user.

    - Offer significant vendor-supplied software for execution on vendor-supplied intelligent hardware.

- User site hardware services (USHS) are viewed as an alternative delivery method of remote computing services (RCS). As such, USHS both impacts and expands that marketplace.

    - Impacts by replacing vendor remote delivery services revenues.

    - Expands by replacing in-house timesharing and by offering new services to additional USHS users.

- 2 -

INPUT

- The study focused on the USHS approaches and offerings of three current vendors:

    - ADP Network Services, Inc. ONSITE system.

    - National CSS, NCSS 3200 series system.

    - GEIS Company MARKLINK distributed system.

- The planned research for this study consisted of a set of questionnaires developed by INPUT in close coordination with participating clients, used for both telephone and on-site interviews.

- Interviews were conducted during the fourth quarter of 1979.

- The interview sample of 99 companies provided three types of respondents:

    - End users (72).

    - EDP managers (59).

    - Financial executives (21).

- The research contrasted differences among respondents in approach toward, and involvement in, the decision process for USHS.

INPUT

II EXECUTIVE SUMMARY

II EXECUTIVE SUMMARY

A. MARKET FORECAST

- There is a significant market opportunity for user site hardware services offerings from computer services companies now in remote computing services (RCS) markets.

    - INPUT forecasts the total USHS market in 1984 to be $1 billion (Exhibit II-1), which is 13% of the forecasted RCS market.

    - The utility processing services portion of the USHS market, the focus of this study, is forecast to be $300 million by 1984, which is 15% of the forecasted utility services market.

        . Utility services is a new USHS market and is typified by the offerings of National CSS, Inc., ADP Network Services, Inc., and GEIS Company.

        . This market is vulnerable to competition from minicomputer vendors and RCS companies.

    - The industry specialty services portion of the USHS market is forecast to be $600 million by 1984.

- 6 -
INPUT

. Industry specialty services, a more developed market with many active vendors, is less vulnerable to competition from mini-computer vendors.

- Utility services and industry specialty services together are expected by INPUT to represent 90% of the USHS market in 1984.

• The USHS market is driven by cost, which makes conversion of RCS services to in-house systems increasingly attractive to users.

- This is due, in large measure, to continuing reduction in both hardware computational and data storage costs.

- However, users' inability to track and put a budgetary ceiling on RCS costs are also very important factors.

• User site hardware services, part of the evolving distributed data processing market, represent a significant new delivery system alternative to traditional remote computing services.

- Market potential for USHS vendors is excellent. USHS offers low cost entry into the distributed data processing market, a market now primarily in-house.

- Other significant advantages offered by a USHS market strategy include:

. A potential method of getting a portion of in-house timesharing expenditures.

. Evolving specialized services utilizing proprietary software systems integrated with network services.

INPUT

・   Providing entry into the small user area where EDP expenditures are less than $2,000 per month.
B.   MARKET STRATEGY AND MARKET PENETRATION

I.   MARKET STRATEGY

- Key reasons for buying USHS (as shown in Exhibit II-2) should be reflected in the formation of vendor marketing strategy.

  - End users and EDP managers, both essential to buying USHS, should both be included in USHS marketing plans.

  - In some instances, both agree as to the most important reasons for buying USHS, as in the case of Exhibit II-2, where the combined ratings of both end users and EDP managers are complementary.

  - Cost effectiveness is the most compelling reason for replacing RCS with USHS.

    - USHS conversions of RCS achieved cost savings averaging 40%, ranging to 60%, among existing users in this study.

    - RCS costs are regarded by users as being too high. They are also regarded as being unpredictable, making budgeting difficult.

- However, EDP managers, protecting their empires, did not feel that USHS could be as cost effective for in-house timesharing as present mainframes.

NUMBER OF EDP MANAGER RESPONDENTS = 56
NOTE: RATED ON A SCALE WHERE 1 = LEAST IMPORTANT AND 5 = MOST IMPORTANT

INPUT

- The prevalent reason for rejecting USHS found in the study was EDP and corporate management reasoning that USHS was less cost effective than incrementally adding to mainframe capacity to provide time-sharing in-house.

- The prevalent attitude of EDP managers highlights the need to coordinate the marketing of USHS to EDP managers, as well as to end users.

- End users and EDP managers agreed on the importance of vendor proprietary software for USHS.

- Network capability to support multiple remote points was rated highly by both end users and EDP managers.

  - Initially, the network was not regarded as essential by some users, but communications capability was recognized as being essential in future years.

- In other instances, end users and EDP managers rated major reasons for buying USHS very differently, reflecting their contrasting interests and responsibilities, as shown in Exhibit II-3.

  - End users feel that EDP departments are unable to provide internal services equivalent to USHS.

    - Applications development backlogs are averaging 20 months and growing larger.

  - End users want to improve turnaround by having a USHS capability for doing applications development at users' sites.

  - EDP managers gave more priority than did end users to reliability/backup and to maintenance/support.

INPUT

EXHIBIT II-3

REASONS FOR BUYING USHS AS
RATED SEPARATELY BY END USERS AND EDP MANAGERS

NOTE: RATED ON A SCALE WHERE 1 = LEAST IMPORTANT AND 5 = MOST IMPORTANT

- 11 -
- Other reasons for buying USHS that received low ratings from both end users and EDP managers were:

    - Offloading the in-house mainframe.

    - Consolidating outside RCS timesharing contracts.

    - Providing access to remote data bases.

2. MARKET PENETRATION

- National CSS, Inc. market strategy is to sell the IBM-compatible NCSS 3200 series initially as a standalone processor, integrated with NCSS operating software, and optional integration with the NCSS network, using the network for distributed data processing, backup mainframe processing and maintenance.

    - The 3200 is offered for purchase or third party lease.

    - Initial emphasis is to install the units on a standalone basis, with a later effort to tie them to the network after the 3200s have met with customer acceptance.

- INPUT estimates that at year end 1979, NCSS had sold twenty-six 3200 series systems.

    - Including maintenance and network charges, INPUT estimates the total revenues from these sales to be $7.5 million.

    - NCSS revenues from USHS deliveries in 1979 were $5.7 million.

INPUT

- ADP Network Services, Inc. strategy is to lease the ONSITE system, integrated with ADP operating software, and with the ADP network, using the network for data communications, backup mainframe processing and maintenance.

    - INPUT estimates that at year end 1979, ADP had installed 29 ONSITE systems.

    - The ongoing lease base from these installations is estimated to be $6 million per year.

    - INPUT estimates ADP 1979 revenues for USHS to be $3.5 million.

- GEIS Company MARKLINK distributed system is offered for lease or purchase on an unbundled basis. Intelligent terminals are integrated with GEISCO operating software, the MARK III network, and GEISCO clustered computer centers. The network is used for data communications, processing and maintenance.

    - MARKLINK was introduced late in 1978; the product expanded late in 1979, with marketing efforts now being intensified.

    - The first MARKLINK installation is an 800 terminal, national inventory control system for the GE Supply Company. The system is now partially operational.

    - MARKLINK, if successful in the commercial marketplace, will address a larger potential market than that addressed by NCSS or ADP. It is too early to predict market penetration.

3. CONCLUSIONS

- Prospects are good for extending initial NCSS 3200 installations to multiple sites.

INPUT

- None of the existing USHS users interviewed had more than one installation, but several have plans to extend use of the NCSS 3200 to multiple sites in the next three years.

- EDP managers reported that the number of potential USHS installations averaged 9 per company, ranging up to 50.

- INPUT expects the number of intelligent terminals and distributed processors in networks to double in the next five years, accounting for 50% of all EDP services to remote locations.

- Lacking internal capacity to meet end users' needs, EDP managers are feeling the pressure to:

  - Provide for applications development at the user's site.

  - Buy outside software packages.

- The study examined the question of combining user requirements to force procurement of USHS.

  - No single user in the group was large enough to procure a USHS by themselves, so they banded together.

  - In the instances encountered in the study, efforts were not successful. The EDP manager controlled the procurement, and opted instead to increase mainframe computer capacity.

- Users felt that using the in-house mainframe was often more cost effective for in-house timesharing than USHS.

  - This is an important reason for rejecting the NCSS 3200.

INPUT

- In one case, a group of users, considering using the NCSS 3200 to offload the in-house mainframe, was particularly attracted to the NCSS 3200 because of NCSS software.

    . The user's final decision, in concert with the EDP manager, was to upgrade the mainframe because it was felt to be more cost effective.

C. BUYING PROCESS

- The process for procuring computer equipment and services involves an interaction among the end user, EDP manager, financial management, and top management, with different levels of involvement during the procurement process.

    - Identifying need and establishing justification is a joint effort by end users and EDP managers, with occasional contribution by corporate financial officers.

    - Vendor selection is controlled by the EDP manager. End users have an involvement in the selection, but not the responsibility.

    - Vendor approval involves both the chief financial officer and top management, acting on the recommendations of the EDP manager.

    - Final approval of the procurement is generally reserved for corporate management, with recommendations from the chief financial officer.

    - The trend in computer equipment and services procurement is toward increased centralization, with corporate management increasing control of the final decision.

INPUT

- The procurement process is taking an average of five months (ranging up to 24 months) from initiation to final decision for systems over $100,000.

  - The process is taking longer and growing more complex as purchases are more closely scrutinized by management.

- End users have little authority to procure computer equipment or services on their own.

  - End users and EDP managers are working together in this regard, with the EDP manager generally controlling the procurement.

  - End users are developing greater sophistication in data processing as equipment is installed at the user's site. However, users are not presently separating themselves from EDP managers.

- INPUT expects, as time goes on, that end users will have a significantly greater voice in placing intelligence on-site for applications development and operation.

  - EDP managers, in a cooperative effort with end users, will (for purposes of standardization, compatibility, reliability, and maintenance) retain control over hardware and system support software procurement.

- Users have a decided preference for unbundled pricing, but have little preference for purchase versus lease pricing.

- End users and EDP managers have minimal knowledge of the USHS concept or of current vendors' USHS offerings.

  - Their knowledge of, and attitude toward, USHS can be greatly improved by marketing efforts of USHS vendors.

INPUT

- The rate of USHS market expansion will be a direct reflection of increased vendor product offerings both in the utility and specialty processing services segments of the RCS marketplace.

D.   RECOMMENDATIONS

- In view of a $1 billion USHS market forecasted for 1984, INPUT recommends that NCSS expand efforts in marketing the 3200 series as user site hardware.

    - Although there are only three RCS vendors presently in the utility processing services segment of the USHS market, indications are that vendors such as CSC, SBC, and XDS will enter the market in 1980-1981.

    - NCSS risks erosion of its existing client base, together with lost opportunities to participate in DDP, without an expanded USHS product strategy.

- NCSS marketing strategies should reflect opportunities to influence users with 3200 installations to consolidate other vendor remote computing services into NCSS 3200 user site hardware services.

- The current IBM compatible 3200 series as a standalone minicomputer, with limited use of the network, is a good start.

    - However, as the 3200 proves itself with users, emphasis should be placed on using the network to offer access to remote data bases and to interconnect multiple remote sites, capturing market share in distributed data processing.

- Marketing strategy should emphasize single application utilization at remote sites, considering the sale of each standalone product as part of a potential DDP node.

- 17 -

INPUT

- Compatibility issues are important and should continue to be stressed.

  - Provide SNA compatibility with in-house IBM mainframes.

    . An important use of the NCSS 3200 is timesharing, using data from the user's in-house mainframe.

  - Use the NOMAD DBMS system to demonstrate NCSS 3200 system distributed data base capability, sharing data base information among remote users.

- NCSS should use the 12-18 month window afforded by the IBM 4000 series delivery schedule to increase price/performance of the 3200 system to maintain margins (25-40%) sufficient to induce USHS sales.

- NCSS marketing efforts should be coordinated with end users, EDP managers, and corporate management.

  - EDP managers are working closely with end users, assisting them in developing more sophistication in data processing and allowing greater user involvement in vendor selection.

  - When it comes to selecting the vendor and controlling the procurement, the EDP manager is still in charge.

  - Final procurement approval comes from corporate management.

- NCSS marketing strategies should reflect end users' and EDP managers' key reasons for buying.

  - Both agree that the most important factors are:

    . Cost effectiveness.

© 1980 by INPUT, Palo Alto, CA 94303. Reproduction Prohibited.

INPUT

- Proprietary vendor-supplied software.

- Network capability.

- EDP managers also stress:

  - Reliability and backup.

  - Maintenance and support.

- End users also stress:

  - Ability to do applications development at user site.

- Emphasize NCSS 3200 marketing efforts in specialty applications in industry market sectors with significant DDP market potential.

  - Inventory control, including warehousing, for discrete and process manufacturing companies.

  - Financial management and planning systems for public utilities.

  - Order entry for distribution industries.

- Expand USHS product offerings to include micro-based systems to offer information services to corporate financial officers based on Dun & Bradstreet data bases.

INPUT

THE COMPANY

INPUT provides planning information, analysis, and recommendations to managers and executives in the information processing industries. Through market research, technology forecasting, and competitive analysis, INPUT supports client management in making informed decisions. Continuing services are provided to users and vendors of computers, communications, and office products and services.

The company carries out continuous and in-depth research. Working closely with clients on important issues, INPUT's staff members analyze and interpret the research data, then develop recommendations and innovative ideas to meet clients' needs. Clients receive reports, presentations, access to data on which analyses are based, and continuous consulting.

Many of INPUT's professional staff members have nearly 20 years experience in their areas of specialization. Most have held senior management positions in operations, marketing, or planning. This expertise enables INPUT to supply practical solutions to complex business problems.

Formed in 1974, INPUT has become a leading international consulting firm. Clients include over 100 of the world's largest and most technically advanced companies.
