MARKET OPPORTUNITIES IN THE NON-IT TRAINING MARKET EUROPE 1992-1997

ABOUT INPUT -

Since 1974, information technology (IT) users and vendors throughout the world have relied on INPUT for data, objective analysis, and insightful opinions to support their plans, market assessments and technology directions particularly in computer software and services. Clients make informed decisions more quickly and save on the cost of internal research by using INPUT's services.

Call us today to learn how your company can use INPUT's knowledge and experience to grow and profit in the revolutionary IT world of the 1990s.

CUSTOM CONSULTING -

Many vendors leverage INPUT's proprietary data and industry knowledge by contracting for custom consulting projects to address questions about their specific market strategies, new product/service ideas, customer satisfaction levels, competitive positions and merger/acquisition options.

INPUT advises users on a variety of IT planning and implementation issues. Clients retain INPUT to assess the effectiveness of outsourcing their IT operations, assist in the vendor selection process and in contract negotiation/implementation. INPUT has also evaluated users' plans for systems and applications downsizing.

I Introduction

Δ

Objective

The overall objective of the study conducted for IBM Europe (IBM) is to assess the opportunities in the total training market for Europe, ie. for all types of training services, not just those related to IT. INPUT defines training as job-related skill acquisition which occurs outside the traditional educational curriculum. It is distinguished from education which is vocational in nature and is usually related to a curriculum which covers at least one academic year. The study is targeted at defining the size and expected growth rate of this market, analysed by significant sub-sectors and individual countries. The most important sub-sectors for analysis at this overview stage are:

- · Industry group, ie. Government (Central and Local), Manufacturing and Services,
- · Size of organisation, ie. Large, Medium, Small. (For the purposes of this study, only Large (more than 5,000 employees) and Medium (500 to 5,000 employees) companies will be researched).

I-1

B

Scope

Two principal parameters define the scope of the study:

- · Subject matter for training
- · Geography.

For this study the subject matter is defined as follows:

- The potential target market for training services is the *end-users* within government, commercial and financial organisations. End users employed by these organisations, are defined to include the following: executives, managers, sales staff, specialist professional staff, office, administrative, production and customer services staffs
- All these end-users have requirements for training in areas defined as being beyond IT, or non-IT specific. These training services are defined to be split into a number of segments, depending on the domain covered in the subject matter. At this stage INPUT is using the following domains:
 - Business Transformation
 - Management Development
 - Personal Development
 - Quality Management skills
 - Functional/Professional skills/qualifications
 - Vocational Training
 - IT Training
 - Company-specific skills (programmes, projects, procedures, etc.).

It was envisaged that this segmentation could change as a result of the study findings. In fact, what has happened has been that INPUT has refined its understanding of the categories used, to the extent that we can now appreciate the ways in which the various types of courses could be classified in different ways.

Business Transformation as a domain has only been used in cases where training has been identified by a user as an element of one or more major projects, which were planned as part of a strategy to transform or re-engineer major business processes.

The geographic scope of the study would be limited to the following European countries:

Major:

- · Germany
- · France
- · Italy
- · The United Kingdom

Other:

- · Spain
- · Switzerland
- · Nordic region (particularly Denmark)
- · Belgium
- · Netherlands.

C

Methodology

The primary aim of the research process used in this project is to obtain demand-oriented data concerning the total training market in Europe and the opportunities for the non-IT related portions of the training services market. Consequently the principal focus of the research was on user interviews designed to determine user expenditure patterns, and to elicit key indicators and insights regarding their perceived and real demands for current and future training services.

The research project commenced with the preparation of a questionnaire designed to meet these requirements. This questionnaire was based upon the discussions held at IBM's La Hulpe offices on 15th July 1992 between MM Bernard Donnay and Alain Monot of IBM and Mr. M. Longy of INPUT. It was refined during the early part of the project in August by discussions which also involved IBM's market research professional staff. The main areas covered by the user questionnaire, a copy of which appears in Appendix E, are:

- · Market sizing by expenditure group, including:
 - In-house costs (training staff, facilities/overheads)
 - External spend (seminars/conferences, courses--standard and customised, off-the-shelf materials, customised materials, equipment)

- · Market sizing by domain (for domains see under Scope)
- · Trends in services delivery, particularly:
 - Computer-assisted techniques (CBT, distance learning and other uses of multi-media products)
 - Use of methodologies, facilities and tools
 - Development of a training philosophy
 - Buying patterns and vendor selection criteria and processes.
 - Responsibility for training.

INPUT recommended that at least 50% of the 50 interviews should be conducted on a face-to-face basis and the remainder by telephone. Clearly it is less costly to conduct telephone interviews than to conduct face-to-face interviews, but a more detailed discussion and exploration of important issues could be accommodated in a face to face situation in order to extrapolate from the sample to the complete European picture. In fact, 31 interviews were conducted on-site and 19 by telephone.

INPUT commenced the field research in the middle of August 1992 and conducted 50 interviews across Europe with the help of six locally based or native speaking consultant interviewers; 10 interviews in each of the designated major countries, and another 10 spread across the other countries. The interviews were conducted by the consultant-level staff in the language of choice of the respondent, which was normally his/her mother tongue. Interviewers were allocated between four and thirteen interviews each depending upon their location and language ability. Due to the period coinciding with the summer vacation months, the interviewing was not completed until the last week in September--the tenth and final interview in Italy was received at INPUT on 25th September 1992.

The matrix for the target interview quota, tabulated by country, industry group and size, is shown at Exhibit I-1. The actual set of interviews obtained, again shown by country, industry group and size, is given at Exhibit I-2.

In addition to the field research, desk research was conducted in order to access the available literature on training markets, and to obtain any necessary demographic, economic or business statistics to enable us to prepare valid market forecasts. INPUT's own existing research results in the field of IT-related education and training services were used to cover that portion of the market and in order to develop as accurate a picture as possible of the available opportunities.

Upon completion of the field and desk research activities, INPUT has analysed the data in specific ways in order to prepare this written report.

D

Report Structure

This report contains the market analysis and forecasts by expenditure group and by domain. It also provides the written supporting argument together with our conclusions and recommendations. Wherever possible user comments have been included in the report.

The report structure is as follows:

- · Chapter I, the Introduction, outlines the terms of reference and conduct of the study
- Chapter II, the Executive Overview, contains the principal findings, conclusions and recommendations
- · Chapter III describes the User Research undertaken and gives a description of the information gathered, the ways in which it was analysed and how the market sizing and forecasting was derived
- Appendix A contains the set of definitions for Training Domains, which were agreed with IBM
- Appendix B contains INPUT's standard set of Economic Assumptions, which are applicable to all studies where forward forecasts are given
- Appendix C describes the method used in this study to estimate the size of the overall expenditure of users on trainees' salaries.
 Although it does not form part of the potential market, this is an important element of the total user expenditure on training.

- · Appendix D contains the synopses of the 50 user interviews. It is structured as a set of tabulations of the key aspects of each interview.
- · Appendix E contains a copy of the English language version of the user questionnaire.

A copy set of all 50 user questionnaires is also part of the output delivered to the client from this study. They are provided under separate cover as an Annexe to this report.

II Executive Overview

A

Total Training Market in Europe

1. Market Size and Growth

The total market for Training in Europe comprises:

- · Training Services provided by external training suppliers
- · Training Products supplied by external suppliers
- · Travel & Accommodation Costs for training courses
- · In-House Expenditure on trainers' salaries and overheads such as building facilities.

In addition there is a very significant component of user expenditure associated with the proportions of the trainees' salaries which can be allocated to the time they spend on training courses, whether conducted on a vendor's premises or in an in-house training facility. This component of expenditure is not counted as part of the potential market, because it cannot be converted from being an In-House cost to being a cost incurred with an External supplier.

INPUT has been able to quantify this overall market for 1991 and 1992, and to forecast its growth through to 1997, in a number of different segmentations:

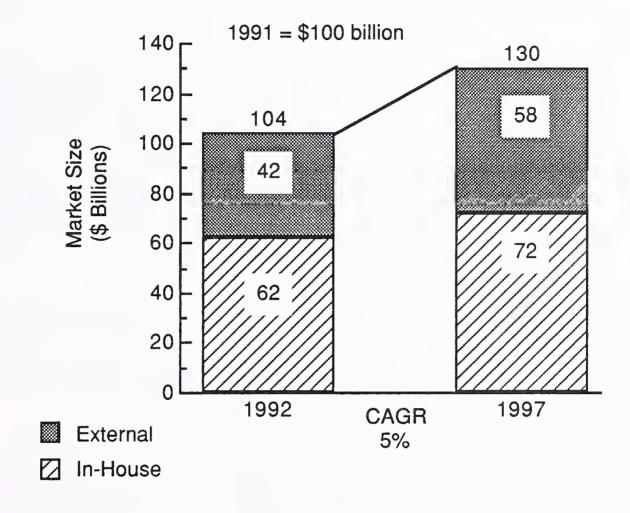

- · By Product Group
- · By Country
- · By Training Domain.

INPUT has also segmented the market by size of organisation but has not been able to extend this sizing operation into a market forecast.

Exhibit II-1 summarises the size and growth of this multi-billion dollar potential market in column chart form, showing the major split between the External and the In-House sectors. When first measured in 1991 terms it was a \$100 billion market. It grew by 4% to reach \$104 billion in 1992, in spite of recessionary pressures felt in certain countries, particularly the United Kingdom and the Nordic countries. As recession gathers pace in the important German and other economies, the overall market is expected to fall to \$100 billion in 1993. It is then forecast to start rising again as certain countries (notably the U.K. and France) start to exit from recession in 1994, and to continue this expansion until it reaches \$130 billion in 1997. Over a 5-year period this growth is equivalent to a compound annual growth rate (CAGR) of 5%.

EXHIBIT II-1

Training Market in Europe, 1992-1997

2. Market Components

The next level of detail to which INPUT has gone in analysing this very large and diffuse market is illustrated in Exhibit II-2. Here the overall market is segmented into five components, three of which are counted as parts of the External or open market, the remaining two being counted as parts of the In-House or closed market:

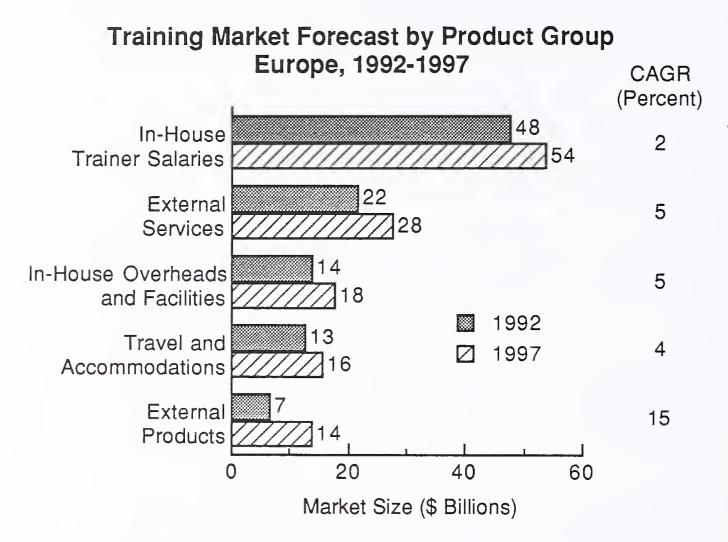

- External Services covers three types of training service, all of them having the common characteristic that trainees attend courses and other events at which instruction is given or information imparted by lectures or other audio-visual (A-V) means including the use of computer workshops to practice the skills and knowledge gained,
- External Products covers a number of different types of product ranging from the 'soft' (software, courseware or books) to the 'hard' (equipment such as A-V aids, personal computers or complete CBT systems),
- Travel & Accommodation means the costs incurred with external organisations, normally in the transportation and hotel businesses, which are responsible for transporting trainees to and from their courses or other training events, and for housing and feeding them while they are away from their workplaces;
- Trainers' Salaries is the first of the two In-House components. This segment is taken to include the proportion of managers' salaries equivalent to the time they devote to the planning and implementation of training courses for their individual staffs, as well as the salaries of professional trainers and training department managers, employed as part of the personnel establishments of each organisation. These salaries are put in at their full overheaded rates,
- Overheads and Facilities is the second In-House component. This segment covers all buildings and specialised areas of buildings dedicated purely to the training function, such as central Training Schools or Lecture Theatres. It is also defined to cover any equipment or items of a capital nature not covered in the other segments.

The bar chart in Exhibit II-2 indicates the size and compound annual growth rate for each of the five segments:

- The In-House components are together greater than the External market sectors, though not growing quite as fast. The ratio of the two is roughly 3:2
- Trainers' Salaries is the largest single segment, although it has the slowest growth rate
- External Services is the second largest with a near average growth rate
- External Products currently the smallest segment is scheduled to grow from this smaller base at the fastest rate of any of the five segments.

II-5

EXHIBIT II-2

Note: Market values are rounded causing CAGR values on occasion to appear inaccurate.

3. Non-IT Training Market Compared to the IT Training Sector

In this report the IT training sector has been measured as part of the overall Training Market and allocated a separate Domain to allow it to be shown separately. The Non-IT training market-place (which is defined to cover all the other Domains) has a different feel to it compared to the IT sector, the sector which IBM knows well and in which IBM has been principally active up to now. This difference stems from the fact that there are a different set of characteristics which predominate in each market. Although IBM has some experience already in certain of the Non-IT sectors, notably Management Development and Quality Management training, particularly through its work at European level in the La Hulpe Training Centre, it is worth highlighting the differences which will affect how services and products might be marketed in other Non-IT sectors:

- · Whereas the overall market contains a number of domain segments, each with its own characteristics and key aspects--business management, technical knowledge, personal psychology, product features and functions--the IT sector is very largely orientated towards the training of users in the use of particular products, sometimes a hardware product, sometimes a software product. This means that the structure of the training is more readily definable, following as it needs to the structure and features of the products being taught
- Whereas the IT training market is serviced in the main by external providers, the Non-IT sectors have a longer tradition of carrying out training in-house. This dominance of the in-house segment is reflected in the fact that the largest domain of any is the Company-specific training sector
- · Formal training management systems as understood by IBM-incorporating a computer-based Skills Inventory, a Career
 Development methodology, and a systematic Training Evaluation
 technique--are offshoots of the IT industry. In the general training
 field, INPUT found through this study that the majority of users are
 content with an informal management system for their training
 activities, one tied quite often to the structure of the personnel
 function. In several cases users were even sceptical of the
 advantages of a more formal approach

YE-TSI II-7

- The IT sector is a leader in the application to training of the new multi-media technologies. As evidenced by the current study, the general training field is, with some major exceptions, still suspicious of the benefits of these new technologies, from the standpoints of both cost and effectiveness
- Although the IT training sector is still very fragmented (there are estimated to be at least 1,000 suppliers operating in Europe) some important companies are starting to emerge as market leaders from among the ranks of both the independents and the equipment vendors. By contrast, no strong market leaders were encountered during the present study of the Non-IT sectors, and INPUT estimates that in the order of 10,000 vendors are active across the whole market-place.

Exhibit II-3 summarises the key differences between the worlds of the IT and the Non-IT sectors.

EXHIBIT II-3

Characteristics of Non-IT vs. IT Sectors

iT	Non-IT
· Product-based	 Multi-domain (business, personal, product, etc.)
· Largely external	· Majority in-house
Formal management systems available	· Management informal
· Technology leader	· Suspicious of technology
 Some market leaders emerging 	· Still highly fragmented

B

Training Markets in the Major Countries

The Training Markets in the larger countries of Europe are closely allied to the relative values of Gross Domestic Product (GDP) in each country. The largest markets are therefore found in Germany and France, with the United Kingdom, Italy and Spain following in that order. The other countries of Europe which include developed markets, e.g. the Nordic and Benelux countries and Switzerland, when taken together account for a market value which is second only to Germany in size.

The more mature and developed a market, the more likely it is to have a slower growth rate. The Training Market is no exception to this rule. Of the major countries Spain and Italy have the higher forecast rates of growth for the 1992 to 1997 period, 8% per annum CAGR and 7% respectively.

Exhibit II-4 illustrates the relative sizes and growth rates of the markets in the countries researched in the form of a standard bar chart.

EXHIBIT II-4

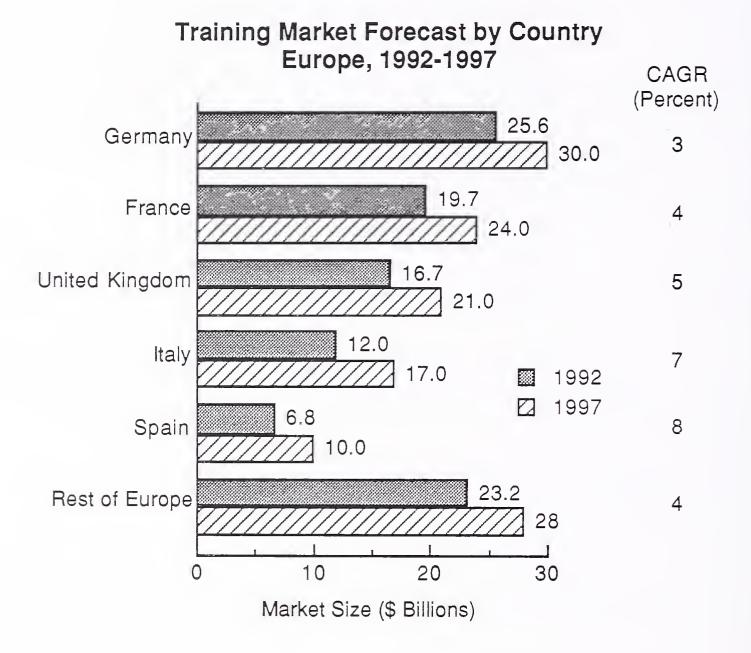

Exhibit II-5 is a table showing the breakdown of the 1992 market by major country and by the size of user organisation, based on the three size groups defined in Chapter I. Large and Medium-sized organisations account for roughly the same amounts of expenditure as each other, while Small organisations spend just over half of this amount.

EXHIBIT II-5

Training Market by Country and Company Size, Europe 1992

	Market Size (\$ Billions)								
Country	Large	Medium	Small	All Sizes					
France	8.6	6.9	4.2	19.7					
Germany	8.1	12.8	4.7	25.6					
Italy	4.6	4.4	3.0	12.0					
Spain	3.4	2.2	1.2	6.8					
U.K.	8.6	5.9	2.2	16.7					
Rest of Europe	6.9	9.3	7.0	23.2					
All	40.2	41.5	22.3	104.0					

Note: Large = More than 5,000 staff; Medium = Between 500 and 5,000; Small = Less than 500

(

Training Market Domains

The segmentation by training domain seeks to divide the market into a number of submarkets each of which would have its own separate set of user requirements, characteristics, trends and market leaders. The list of domains selected by IBM is derived from current market practice and is therefore more empirical than theoretical. As a set of definitions it suffers from the strengths and weaknesses of this sort of empirical approach:

• Its main strength is that it is recognised in the market-place and individual vendors see themselves as active in particular sectors and not in others

• Its main weakness is that it makes market sector measurement very difficult, because particular training services encountered in the course of research can be allocated in some cases to one or another of the sectors depending upon which criteria have priority. This has implications for forecasting.

INPUT would like to see an attempt made to work out a more theoretically rigorous segmentation by domain which could act as a basis for strategic positioning within the overall market for training products and services.

Exhibit II-6 shows the forecast of the Total Market (including the External and In-House components) for training in Europe, in its Domain dimension breakdown. Exhibit II-7 gives the equivalent breakdown and forecast for the External component of the market. Considered together the two show the ways in which the various domains are affected by the user acceptability of the external provider:

- Business Transformation has the highest growth rate in the overall market and the second highest in the External sector. It is a young sector and is starting from a relatively low base value
- Company-specific training is a sector which has hitherto been dominated by the in-house approach but will start to move towards the use of external suppliers, as the outsourcing of highly customised and even specialised training starts to grow in popularity. Again starting from a low base, it will nevertheless enjoy the highest growth rate in the external sector
- Management Development training will also experience a trend towards the use of external suppliers, so that with the third highest growth rate in the external sector, its component in the external market will grow over the five-year period from a 33% to a 45% share
- IT, Quality Management and Vocational training will also all experience double-digit growth rates of their external components over the period, each under the pressure of different driving forces.

EXHIBIT II-6

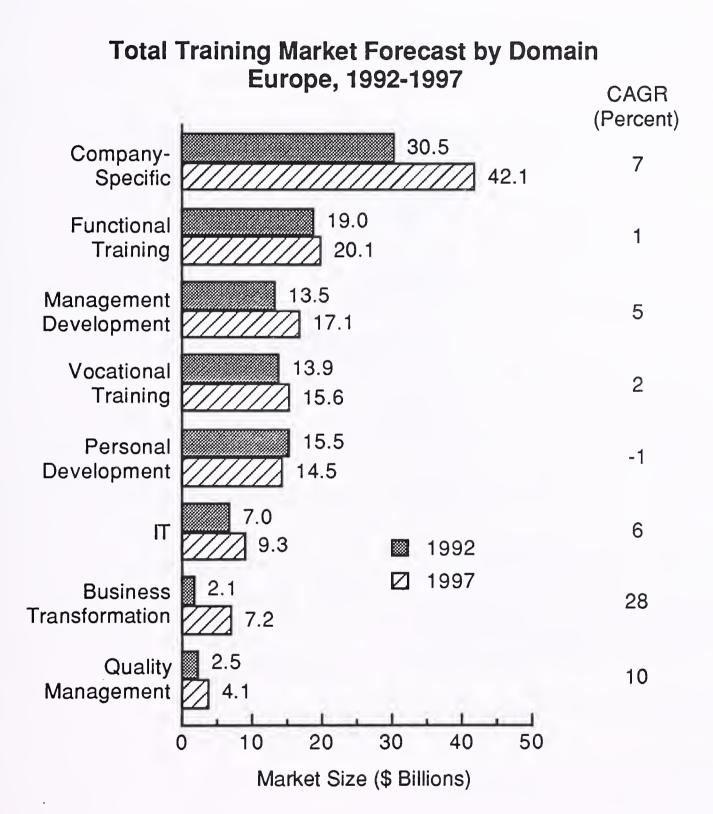

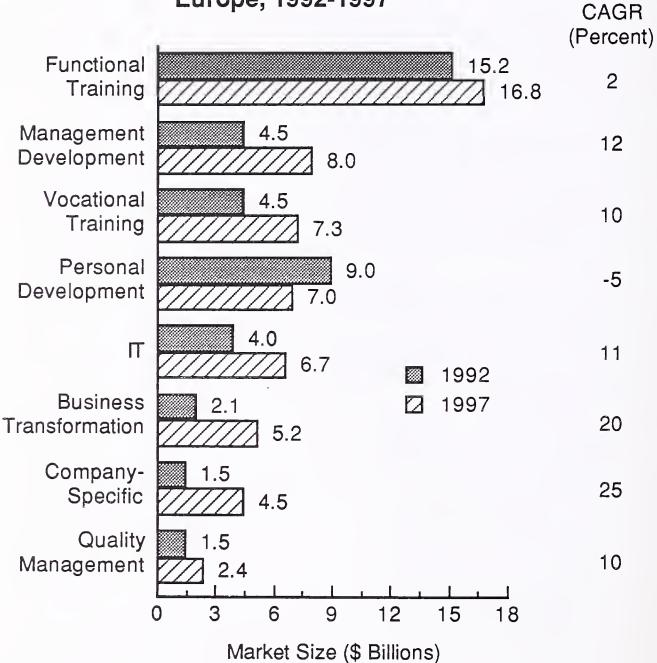

EXHIBIT II-7

D

Findings of the User Research

INPUT has undertaken an initial analysis of the 50 in-depth user interviews which were obtained during the late summer of 1992. The aims of this analysis were twofold:

- Firstly to examine the qualitative information provided by these interviews in the broadest possible way, and at the same time to extract the key factors comprising the market trends and issues as perceived by our research sample
- · Secondly to extract the important quantitative information on which to base our market sizing and forecasting operations.

Highlights of the findings of the qualitative analysis include the following:

- · Although the task of specifying training programmes falls to a wide range of departmental and divisional managers, it is the role principally of central training and personnel functions to select external providers of products and services
- · Most training is national in scope
- · Management of training activities is undertaken in conjunction with the standard annual review of personnel, although there is a longterm trend for training to become less orientated towards the improvement of the individual and more towards the improvement of the business team. Hitherto this had been characteristic only of the Management Development training sector
- The vendor community is large and consists of many thousands of small providers
- · Selection of vendors is undertaken with quality (both of trainer and training product) a more important criterion than cost
- Professional company training managers and trainers are in the main dissatisfied with the performance to date of computer-based training (CBT) and other new technologies, citing both cost and quality as reasons for preferring the traditional 'warm body' approach

There is a strong current trend to want to pull more training inhouse, although there are some significant instances of organisations which will buck this trend, preferring to outsource their training in its entirety. INPUT believes that a more selective purchasing climate will set in and that this will be complemented by the need to purchase new technology products to support the in-house efforts. To profit from this strategic trend in the Training market, IBM will need to approach the market with a balanced catalogue of training products and services.

F

Recommendations

The current project has found the total training market in Europe to measure around \$100 billion, of which over \$40 billion relates to expenditure with external providers of products and services. Inevitably in a market of this size there are many opportunities for a vendor determined to succeed. However such a market possesses many different sectors each with different characteristics and critical success factors, and each populated by different vendors. In the current study, relying as it does mainly on the evidence of 50 user interviews to discover something about all the various market conditions and trends, it is not possible to do more than size the overall opportunity. The next stage of investigation must take as its objectives the tasks associated with decisions about market entry.

INPUT is therefore making three recommendations for further work leading up to the major decisions for:

- · Assessing priorities between sectors based on solid information about the different factors required to succeed in each
- · Selecting sectors for market entry based on their satisfying IBM's business criteria for entry.

INPUT's three recommendations are:

• Undertake further analysis of the existing 50 interviews in order to obtain as full a picture as possible of the user requirements and attitudes

- · In parallel with this user analysis, undertake some vendor research and analysis with the aims of:
 - Assessing the competitors in the most promising sectors
 - Investigating the advantages and disadvantages of using the acquisition route as a means of fast entry into the Non-IT training sectors
- · Establish a positioning strategy for the company, prior to market entry, so as to ensure a period of continuing success in this new venture area.

II-17

III User Research

Δ

Characteristics of the User Sample

Although the assignment stated that half the interviews were to be conducted by face-to-face meetings, in fact a majority of them were conducted by this method--ie. 31 out of the 50 completed interviews. Only in Spain and Belgium were there no face-to-face interviews. Exhibit I-2 shows the breakdown by country and by type of interview, illustrating the extensive use of this method in Germany and the United Kingdom, and its less than average use in France.

1. Split by Country

The objective of the user research undertaken was to cover the market at a European level. To this end it was decided that with the limit of the 50 in-depth interviews commissioned, it was best to interview in all four of the major country markets, ie. France, Germany, Italy and the United Kingdom, but only in a selection of the smaller countries. The smaller country markets chosen included:-Spain (now threatening to grow rapidly into one of the larger markets), Belgium, Netherlands, Switzerland and Denmark (representing the Nordic group of countries).

A set of 10 interviews was chosen as the quota for each of the larger markets, Spain was allocated a quota of four interviews, and the other smaller countries were given one or 2 each. The quotas by country were achieved.

2. Industry Group

In order to balance the sample as much as might be possible with such a small number, it was decided to split industry sectors into three groups:- (1) Government (including both central and local government organisations), (2) Manufacturing industry (including both Process and Discrete manufacturing, as well as the building and construction sectors), and (3) Services (defined to include all other industry sectors, such as Wholesale and Retail Distribution, Transportation, Communications, Banking, Insurance, Business and Technical Services, and the primary sectors--Agriculture, Fishing & Forestry). The target quota was aimed at providing fewer interviews in the government group than in the other two sectors, ie. using the ratio 10:20:20. In fact the research yielded a smaller proportion than planned in the government group (the ratio of the actual interviews achieved was 5:20:25), with the difference (of five) being taken up by the services group where financial services sectors provided easier completions than might have been anticipated.

3. Size of Organisation

Although the overall training market was conceived as affecting three sizes of organisations (Large, Medium and Small), it was decided only to research the top two size groups, because of the expense involved in covering small organisations in sufficient numbers and also because of the applicability of the '80:20 rule', which would imply that 80% of the training market value would be covered by the first 20% of companies by size.

Because of the difficulty of deriving an equivalent of sales revenues for many financial services companies, the size of organisation was chosen to be determined by the number of employees, with the following size levels being used:

- · Large organisations were required to have at least 5,000 staff
- · Medium sized organisations to have from 500 to 5,000 staff
- · Small organisations being taken to have less than 500 staff.

It was the intention to have slightly more Large organisations than Medium sized ones (26 against 24), and this was achieved in practice with an actual split of 28 Large against 22 Medium sized.

Exhibits I-1 and I-2 tabulate the target interview quota and the actual quota achieved respectively.

III-2

B

Analysis of the Individual Interviews

Each of the 50 interview questionnaires was examined and a series of data, called the Key Factors, was extracted. These factors were those judged by INPUT to illustrate most effectively the information required by IBM. These Key Factors were arranged in a table, one for each organisation interviewed, and the set of tables forms Appendix D to this report. The organisations were analysed in the following sequence:

- · By Country--Germany, France, United Kingdom, Italy, Spain, Switzerland, Denmark, Netherlands, Belgium
- · Within Country by Industry Group--Government, Manufacturing, Services
- · Within Industry Group by Size of Organisation--Large, Medium.

1. Basic Information

The basic information collected from each questionnaire fulfilled three objectives:

- · To identify the respondent or respondents
- To allow each organisation to be analysed according to certain major criteria of the study:
 - Country
 - Size of Organisation
 - Industry Group
- To act as a body of information about the organisation with which to interpret other responses obtained during the interview.

Two important items included are:

- The revenues the organisation obtained in 1991. In some cases these could be obtained from the annual report, but if an annual report had not been provided, the figure shown was estimated using all already known facts, e.g. Number of employees, revenues for an earlier year or 1992 revenues as estimated by the respondent. The revenue figure shown is in all cases the equivalent revenue for the part of the organisation for which the respondent(s) had training responsibility
- The expenditure (Spend) on Education & Training during 1991, as given during the interview or as estimated from other information given, in those cases where the respondent(s) did not know or could not divulge the true or complete figure. The figure shown is in all cases inclusive of both external and in-house expenditures.

The Basic Information for each organisation is positioned at the head of each Key Factor table.

2. Responsibilities & Structure

This item is designed to illustrate the extent and spread of responsibility for training within each organisation. The principal matters dealt with are:

- · The responsibilities of the respondent(s)--both breadth and depth
- · The size of any central training department
- The number of managers with responsibility for specifying training (the specifiers)
- The number of managers with responsibility for purchasing training (the purchasers)
- · How training responsibilities are allocated across the whole organisation.

3. Training Domains

This is one of the most important analytical axes for IBM, as it relates to the way in which the overall market might be segmented and thereby become amenable to marketing techniques.

At the outset of this project IBM and INPUT agreed to work with the following training domains:

- · Business Transformation
- · Management Development
- · Personal Development
- · Quality Management skills
- · Functional/Professional skills/qualifications
- · Vocational Training
- · IT Training
- · Company specific skills (programmes, projects, procedures, etc.).

These domains are differentiated primarily by the subject matter and aims of the topics taught. Fuller definitions of the domains are given in Appendix A.

The information obtained through the interviews has been analysed by INPUT in the following ways:

- The breakdowns given by the respondents, where these were known, have been used as the principal basis
- Respondents in France and Germany were recontacted by telephone in order to improve the breakdowns given, in particular in relation to the understanding of the Quality Management domain. This was requested by IBM because the translations into French and German of the phrase Quality Management were rather inexact and could have been confused with Quality of Management

YE-TSI III-5

- In cases where the respondent(s) did not know the domain breakdown or used a different method of breaking down training expenditure, ie. according to categories specific to their own organisation, the standard breakdowns were estimated from other information given in the appropriate interviews, or, alternatively or in conjunction, with the aid of knowledge which INPUT accumulated as analysis of the sample progressed
- The final breakdowns recorded in the Key Factor tabulations are the result of bringing together all the above work and techniques, so as to provide a homogeneous set of expenditure breakdowns, from which forward market forecasts could be derived.

These breakdowns have been used as a main plank in the building of the market forecasts by Training Domain, which are given later in this report.

4. Transnational Activities

In order to identify the more immediate and larger training projects, it was decided to include in the sample the sorts of organisations which would have multi-national activities. Of particular interest would be concerns which designed training activities on a transnational basis, either at an in-house training school or on an international basis with an external training provider. The responses to this type of question were analysed in two ways in the Key Factor tabulations:

- The split between training required in the country of ownership and training required in overseas operations was recorded
- The amount of training expenditure set against training organised on a transnational basis was also recorded.

In practice only small amounts of expenditure were on average set against international/transnational training activity, and in most cases this was for top management training. However, there is an overlap here between transnational activity and Business Transformation projects. Whereas the former are more easily isolated in terms of formal classroom training, the latter more likely involve general business projects in which training is merely one among many aspects all calling for budgeted expenditure.

III-6

5. Cost Breakdown by Product Group

This is another of the principal axes for market segmentation. Product Group is defined as the grouping of different training products and services under standard headings current in the industry. It was the objective of the study to use standard headings which would be easily recognised within the industry. The headings selected were taken from a similar study undertaken in 1990 at the commission of IBM to report on the Training Market in the U.S.A. The headings are defined at two levels:

- · On the first level the split is between Costs incurred as a result of In-House expenditure on training and Costs incurred in expenditure with external training providers
- · On the second level a finer structure can be given for each of these two categories.

The subheadings for each are:

- · For In-House expenditure:
 - Salaries of Trainers, ie. persons employed as part of the staff of the organisation; also taken to include the proportion of managers' salaries applicable to the time they spend on training activities, e.g. planning, preparing and running courses
 - Facilities/Overheads, taken to include capital and running costs for rooms, buildings and estates dedicated to training activities, and a proportion of the overheads loaded onto general buildings to cover the cases of rooms and buildings which house shared activities, ie. are not dedicated solely to training activities;
- · For External expenditure:
 - Conferences/Seminars (whether held on user or vendor premises and usually differentiated from Courses by being of highly topical interest and of short duration)
 - Standard Courses (usually but not exclusively held on vendor premises and often lasting somewhere between one day and two weeks)
 - Custom Courses (usually but not exclusively held on user premises and of similar duration to Standard Courses)

YE-TSI III-7

- Standard Materials, defined as any books, printed matter or electronic publishing products (such as CD-ROM training disks) on general sale to the open market and purchased to support training activities
- Custom Materials, defined in a similar way to Standard Materials above, but differing from them in that they have been specially designed by a vendor to support the training activity of the purchasing user
- Equipment, defined to include all capital and consumable equipment purchased to support training activities, and taken to include dedicated CBT and video systems
- Other, a category not in fact used but reserved to cover anything which might be encountered and could not be put into any of the previous categories.

Analysis of the questionnaires and reading of technical and trade literature, however, reveal that the situation is in practice complicated further by a number of factors:

- Many professional trainers and businessmen regard the salaries of personnel being trained as also a part of the cost of the training function. This is particularly applicable to apprentices and others undergoing long-term vocational training periods, sometimes lasting several years
- A fair proportion of respondents to this study were not able to provide a breakdown of their organisations' costs to the level of detail we were seeking. Either it would have taken too long or they did not think that the information was gathered in the way we wanted. In many cases they were only able to give an estimate of the budget split between In-House and External expenditures
- There was evidence of confusion in the minds of some respondents over the differences between splitting expenditures between In-House and External, and splitting according to the amount of training performed on their own premises and the amount performed on the premises of external vendors.

Taking all these factors into account INPUT has provided an expenditure split by Product Group for each responding organisation. Where it was possible (and this is a minority of cases), we have also given a view as to how this split might change by 1996. Also provided is a pair of figures showing the percentages of expenditure made through a central training function budget and through decentralised budgets at lower levels within the overall organisation.

These breakdowns have been used as a main plank in the building of the market forecasts by Product Group, which are given later in this report.

6. Training Management System

The intention of the examination of training management systems was to shed light on the degree of formality with which the sample were conducting the management of the training activity. In this area our finding is that the degree of formality which IBM would expect as a good standard is considerably in advance of the average practice encountered in the market-place.

The questions in this area were structured around three aspects of management systems and the user responses have been recorded under the same three headings:

- · Keeping an Inventory of Skills--either manual or computerised
- · Career and Skill Development
- · Evaluation of the Results of Training.

In the majority of cases, skills, development and evaluation were all three tied to the standard personnel record of the individual, although recording at team and departmental levels also occurred

YE-TSI III-9

This section of the Key Factor tabulations also contains a summary of the range of standard amounts of training, which organisations planned as a matter of policy to give their staff. These ranges have been recorded in Numbers of Hours of Training given per annum to each staff member and converted where necessary to hours from other time units given in the responses. In those cases where a less than complete response had been given regarding training expenditures, this set of figures was found to be useful to derive, or cross-check on, the training expenditure budgets provided on the questionnaires. It would also prove a useful figure to use to calculate key training ratios for comparison between practices in different countries, different industry groups and different sizes of organisations.

7. Decision Making

Responses connected with the Decision Making process are recorded under the two aspects mentioned above under Responsibilities & Structure:

- Those specifying the type of training needed (Specifiers)
- · Those selecting the appropriate trainers (Purchasers).

Also recorded for each organisation in the sample is the way in which the decision levels might change over time.

Noteworthy in this section is the fact that practically no respondents could see any changes in the people involved taking place in the future. Either they are unable to contemplate change, because as major participants they are too close to the situation, or else the target audience for training products and services is remarkably stable.

8. External Suppliers

Up to six external providers' names have been recorded in the Key Factors tables for each organisation. In most cases only three have been given. The sequence of the names is the order of importance deduced by INPUT, from the sequence in which they were provided on the questionnaires as well as from the number of times particular vendors might be mentioned, if used for training in more than one domain. Several respondents cited the fact that the number of vendors used was too numerous for them to pick out any in particular; several also mentioned their in-house training functions as if they were equivalent to external vendors.

III-10 YE-TSI

Two key findings stand out from the information provided in this section:

- The Training Market in Europe is incredibly fragmented. INPUT estimates that, taking into account all sizes of firm including individual training consultants operating as single proprietor businesses, there are on the order of 10,000 training providers in the European training services market-place, ie. excluding organisations providing materials and equipment only, and excluding peripheral organisations providing ancillary services such as those in connection with travel and accommodation to courses and other events held externally
- · Most training services providers operate on a national level only. The exceptions are found in the top range of Management Schools such as INSEAD and IMD, and in this respect the non-IT market differs from the IT sector. In the latter sector there are emerging or have emerged some large multi-national suppliers of training services and training products, eg. the large equipment suppliers and certain U.S.-owned providers like Applied Learning and Learning Tree International.

9. Buying Factors

A series of purchasing criteria were rated by respondents under three headings:

- · Human factors
- · Product factors
- · Commercial factors.

For the purposes of the Key Factors analysis, the factors with the top three ratings were listed in the tabulation of each respondent in the sequence in which they appeared on the questionnaires. In practice this meant extracting and recording the factors with the top rating of 5, and when there were more than three of them recording up to six instances with the top rating. It would also be possible to average the ratings across the whole sample and/or across various subsamples, in order to be able to rank and rate the factors as a complete set.

The general impression received is that cost issues are of less importance than product quality and trainer proficiency.

10. Use of New Technologies

Several questions in the questionnaire were devoted to the respondents' attitudes to new technologies for training, especially the use of CBT (Computer-Based Training) and video-based techniques, used either on their own or in conjunction with CBT.

For the Key Factor tabulations, responses were summarised under four headings:

- Experience of using CBT and other new media--in order to qualify each respondent's attitudinal information--on the basis of being more sceptical about attitudes formed without very much experience
- · Respondents' opinions as to the relevance of the new technologies to training
- · Problem areas encountered from past experience or anticipated in future use of the new media
- · Other--opinions, facts and figures needing to be recorded to summarise each respondent's overall attitude to future use of new technologies both to his/her own organisation and in the market-place as a whole.

Respondents were, with some outstanding exceptions, expressing reservations about the applicability of CBT and other new media to their own businesses and to the wider general market. Their relevance was seen to be strongest in the areas where knowledge-rich skills were being instilled and weakest in areas where the handling of interpersonal relations was the premium skill required. Because there was less evidence of experience in Distance Learning and Satellite delivery technologies, the comments recorded about these areas add up to a less complete picture.

11. Other Issues & Summary

The final section of the Key Factors tabulation was used to record two types of information:

· Firstly, any general comments about the ways training was currently conducted in an organisation and about ways in which it might develop in future. Comments recorded were selected on the basis of their usefulness in giving an overview of the organisation and its training policies

• Secondly, any important comments or attitudes which had not been included in any earlier section of the tabulation were recorded under this last section.

(

Developments of the Market Forecasts

INPUT's standard methodology for sizing and forecasting Information Services and Information Systems markets consists of two phases:

- Sizing of a market is achieved by researching the vendor revenues obtained in the previous financial year and assessing the breakdown into the segments in use by a combination of vendor interviewing (primary research) and estimation. Estimation makes use of all available secondary research material. Market sizes are converted from vendor revenues into user expenditures by application of a set of standard factors, which are a function of each delivery mode segment
- · Forecasting of a market uses principally user research to assess the ways in which user spending patterns are changing from year to year. It also takes into account the economic situation in each country market in Europe. A growth rate is applied to each market segment, together with a factor to account for inflation in each country, in order to derive a growth/decline in each segment for each of the forward five years in the forecast period. Country level forecasts in local currencies are aggregated using standard conversion factors to convert amounts to U.S. dollars or ECUs.

We can summarise this two-stage procedure by saying that:

- · Sizing depends upon vendor research of a relatively well-known universe of vendors
- · Forecasting depends upon user research assessed in combination with other external data and operates on the market size previously updated in the first stage.

This methodology could not be applied in the current project because:

- · The universe of vendors was not known
- The universe of vendors is too large to be susceptible to the standard INPUT revenue breakdown process.

The forecasting methodology adopted for this project is therefore less exhaustive and less exact. Its major objective is to size the market opportunities so that priorities can be set on further marketing and sales activities, should the basic opportunities discovered be of interest to IBM. INPUT has provided three sets of forecasts, each by a different market 'dimension':

- · By Training Domain
- · By Country or group of Countries
- · By Product Group.

Each forecast has been derived using an empirically derived methodology, which followed the steps described below:

- · User interviews were analysed to establish a breakdown by each of the three dimensions
- · Secondary research publications were examined to attempt a first-level market split by Country
- · Market splits by Domain and Product Group were derived using the splits exhibited by the users as modified by INPUT's assessments
- The market breakdowns established for 1991 were then repeated for 1992 using the short-term growth factors discovered in the research sample
- · All three market splits were re-examined to highlight inconsistencies and were again modified to take account of any discrepancies found
- · Five-year forecasts from 1992 to 1997 were then prepared and reconciled to each other.

It is these forecasts which are presented in the remaining sections of this report.

1. Forecasts by Domain

Exhibit III-1 shows the market forecast for the training market in the whole of Europe segmented by Training Domain. This forecast is given in the form of a table which forecasts the short-term growth to 1993 and the five-year forecast to 1997. Amounts in billions of U.S. dollars are shown together with the appropriate one-year and five-year growth rates in percentage terms. This forecast covers all aspects of the market, ie. both In-House and External Expenditures

Exhibit III-2 illustrates the market forecast by Training Domain for the same period but this time including only the aspects of the market which are currently open to external providers (the External Expenditures). The external market is forecast to grow at a compound growth rate (CAGR) of 6% per annum as opposed to the total market growth rate of only 5% per annum.

Both these forecast tables exclude any allowance for expenditures on trainees' salaries, on the basis that this expenditure is not something which can become available as part of the open market. It may be possible to use as a sales argument the fact that an external trainer can lessen this cost to the user, but it will never be possible to turn it from being a potential into an actual market sector. On the other hand all other In-House costs are susceptible to this treatment, ie. they can be substituted for by a similar service or product provided by an external supplier.

In summary, we can say that Exhibit III-1 represents the total potential market for training in Europe, while Exhibit III-2 represents the total actual market figures.

2. Forecasts by Country

Exhibit III-4 contains the market forecast for the European Training Market segmented by country. The table is presented in the same format as the previous exhibit, ie. it contains both the External and the In-House components and their aggregate, the total potential market. Like the previous exhibit it illustrates how, after declining in 1993 under recessionary pressures, the market is expected to expand again over the following four years, but only at growth rates close to the average inflation rates for the countries.

EXHIBIT III-4

Training Market Forecast by Countr

III-19

3. Forecasts by Product Group

The next two exhibits present the forecasts by Product Group:

- Exhibit III-5 contains the overall market forecast equivalent in numerical terms to the forecasts previously presented, those by Training Domain and Country respectively. The market is shown as expected to decline by 4% in 1993 from a figure of \$104 billion in 1992, but then to expand slowly over the next four years to reach \$130 billion in 1997
- Exhibit III-6 is an extension of Exhibit III-5 which also contains INPUT forecasts for the growth of the trainee salary portion of user expenditure. As noted earlier this component of expenditure is not considered to be a part of the potential market, but is added here in this report for the sake of completeness, since it became an important element in INPUT's sizing and estimating task.

The important findings which need to be noted from the product group analyses are:

- Travel and Accommodation represents 31% of the overall current (1992) open (External) market size of \$42.3 billion
- Training Products in the form of software, CBT systems, equipment and materials represents another 17% of the 1992 open market.

These factors need to be taken into account when comparing the non-IT portion of the market with the IT training sector, with which IBM is much more familiar. The IT sector is much more orientated towards external service providers than is the non-IT portion. Entry into the non-IT training market in a general sense implies entry into both the products sectors and the ancillary services sectors of travel and accommodation. Thus there is a markedly smaller size to the market opportunities presenting themselves to IBM, when the market is measured without these two types of sector, which are of a different type to the market in which IBM has been operating hitherto as a training services provider.

EXHIBIT III-5

Training Market Forecast by Product Group—Europe, 1992-1997 (External and In-House Expenditures)

Product Group	Expenditure 1992 (\$ Billion)	Expenditure 1993 (\$ Billion)	AGR 1992-93 (Percent)	Expenditure 1997 (\$ Billion)	CAGR 1992-97 (Percent)

A IBM Training Domain Definitions

- 1. Business Transformation. Although it contains elements of other domains in combination, Business Transformation is treated as a separate "packaged" domain. Definition is as per IBM's note to INPUT.
- 2. Management Development. Training to improve the performance of managers in all levels of a company. Principally, generic and cross-industry, but some industry-specific.
- 3. Personal Development. Training to improve the performance of staff in any grade/level of an organisation. Excludes Management Development but does not mean managers may not need this type of training. Totally generic; no industry-specific.
- 4. Quality Management. Training to improve quality of products and services marketed by any organisation. Specifically aimed at applying certain techniques to improve the performance of an organisation, eg. TQM, or to preparing organisations for accreditation to national or international quality standard, eg. ISO 9000 or BS 5750.
- 5. Functional. Training to improve the basic knowledge and proficiency of individuals with qualifications which assist in raising their capabilities. Totally cross-industry, overlaps most with Education (as opposed to Training).
- 6. Vocational. Job-orientated training, particularly for non-executive grades wishing to improve their proficiency at what they do now or might hope to do later. Highly, although not exclusively, industry-specific.

- 7. IT (Information Technology). Training related to improving the skills of IT professionals and those using IT as end-users. Essentially a type of vocational training. Includes generic training associated with IT developments, eg. project management for software development. Includes training embedded in large IT implementation or systems operations contracts.
- 8. Company-Specific. All training organised within companies to further the aims of their organisations, and which cannot be put in any of the other categories already defined. A large component of industry-specific training is contained in this category, but essentially it will be allied to an organisation's own procedures, processes and practice.
- 9. Other. A vacant category in case our previous definitions prove not to be exhaustive.

B Economic Assumptions for Forecasting

There follow some notes on the methodology INPUT uses in making forecasts and judging how reasonable they are.

INPUT reports are based principally on three strands of research activity conducted throughout the year:

- · A vendor research programme of several hundred interviews with prominent software and services vendors across Europe. This research assesses their attributable revenues in each country by delivery made and where possible by industry sector. INPUT consultants use their own judgment in many cases to categorise revenues into sub-sectors. In particular INPUT excludes revenues considered captive, such as those from a vendor's parent company.
- Over one thousand vendor and user interviews across all European market sectors to determine trends and opinions. These interviews are part of the research that INPUT carries out in specific sectors of the software and services market. In 1992, for example, INPUT produced reports on over 20 different software and services market sectors.
- Additionally INPUT maintains an extensive library and database of information relating to the software and services industry. This covers, for example, INPUT's customer services programme data: results of INPUT's research into the hardware maintenance market which includes its diversification into the software and services market.

All the forecasts from these activities are produced in local currency for each country, then consolidated with common economic and exchange rate data to produce a top level forecast. This is done for software and services in each country and in Europe as a whole. At each stage it is examined for reasonableness and consistency and if necessary revisited. For example we satisfactorily tested the question: Will predicted user budgets for information systems support the predicted growth rates in software and services?

The forecasts also benefit from assignments for and feedback from INPUT clients, who include over 100 of the leading vendors of software and services around the world. For example: INPUT supplied an economic model to a market leading client on the potential effect of rising oil prices on forecast software and services growth rates. In summary this showed that falling real growth was largely counterbalanced by increases in inflation, resulting in continued high dollar growth forecasts for the market.

In order to consolidate INPUT's forecasts and vendor data into a consistent set of European analyses each year, it is essential to use a standard set of economic factors. The following pages show the inflation and exchange rates in use for 1992 forecasts, and the GDP and consumer price growth rates referred to in the country commentaries.

B-2

A

European Exchange Rates

The following table, Exhibit B-1, shows the standard exchange rates used throughout the 1992 programme to consolidate country market data for overall Western European forecasts and vendor market shares.

EXHIBIT B-1

U.S. Dollar and ECU Exchange Rates, 1992

Country	Currency	U.S. Dollar	ECU

B

European Inflation Rates

Exhibit B-2 shows the average five-year inflation assumptions for each reported country and the changes from those used in reports produced in the previous year. All INPUT forecasts include the effects of inflation as well as natural market growth rates. For consistency, the same inflation rates are used throughout all the different market sector research and analysis during a calendar year, unless specified otherwise.

EXHIBIT B-2

Inflation Assumptions, 1991 and 1992

Country	Assumption 1991-1996	Assumption 1992-1997	Change
France	3.0	2.7	-0.3
Germany	2.7	3.9	+1.2

C Estimating the Trainee Salary Bill

1. Average cost per hour = \$38 fully overheaded

based on: - an average annual wage of \$20,000 - an average no. of days worked per year of 210

- average hours per day 7.5

- an overheading factor of x 3

- 2. Working population of 175 million in 1992 for Western Europe.
- 3. A total of 2,000 million hours of training given in 1992 or approximately 11 1/2 hours per person--split as follows:

- 10% of working population accounted for 1,000 m. hours

- another 20% accounted for 750 m.

- another 20% accounted for 200 m.

- remaining 50% accounted for 50 m.

2,000 m.

4. Average hourly cost rising at 5% per annum. Average no. of hours of training per employee trained rising by 2% per annum.

Average no. of employees trained rising by 1% per annum. These rises to take place from 1984 onwards.

5. 1983 marks a discontinuity with nos. of trainees actually falling.

Other & Summary	- The Belgian subsidiary deals mainly with Production training; general topics such as languages, leadership and other techniques are handled through the Munich headquarters training function.	

Appendix E

Introduction

Our client, who is a large multi-national manufacturing and services group, has asked us to size the European market for all types of training services and to investigate the commercial and technical trends that are impacting it.

In order to achieve this objective, we need to discuss:

- Your training policy/policies
- Training responsibilities throughout the organisation
- Training budgets and their allocation within the organisational structures
- Buying patterns and vendor selection criteria
- Impacts of technology

Q1.	What are your training responsibilities?
And do areas?	you believe that you can answer our questions in most of these
If Y	ES, proceed to Question 2.
If N	O, whom would you recommend that we approach?
	Tel. no.

Interviewer: If another person is recommended please thank the respondent and close the interview. Proceed to set up an interview with the other person recommended.

Comments		
Q2.	What other functions, if any, have responsibility for deciding on the types (specifiers) and sources (purchasers) of training?	
Numbe	er of training specifiers	
Numbe	er of purchasers	
Q3a.	How are training expenditures identified in your organisation? Are the expenditures identified in the annual report? And are they pro rata to each country's/region's revenues or costs?	

Q3b.	Can you please arrange to forward us an Annual Report?
Q4a.	Do you have a significant business transformation project, either on-going or planned, which would require its own major training activity?
Q4b.	How does your company structure affect the way training is specified or delivered?

Types of Training

Our client recognises the following types of training (domains):

- Business transformation
- Management development
- Professional development
- Quality management
- Functional/vocational training
- IT (Information Technology) training
- Company-specific training.

Q5. Is it possible for you to give us the breakdown of your training expenditures across these or across your own categories--in percentage terms, and to indicate which areas are growing and which are shrinking?

	Types of training (domains):	Current Percent	Future Growth
_	Business transformation		
	Management development		
	Professional development		
-	·		
-	Quality management Functional (vocational training		
_	Functional/vocational training		
-	IT (Information Technology) training		
-	Company-specific training.		
-	Other		

Q6a. Is it possible for you to give us a similar breakdown of your training expenditures in percentage terms, but this time by country, and also to indicate in which countries training is growing and in which it is shrinking?

	Expenditures in each country:	Current Percent	Future Growth
-	Germany		
-	France		
-	Italy		
-	U.K.		
-	Spain		
-	Switzerland		
-	Belgium		
-	Netherlands		
_	Nordic countries		
-	Rest of Western Europe		
-	Eastern Europe		

Comments

Interviewer: If the split across non-domestic or any other countries is not known, then use the Rest of W. Europe line for the remainder of the interview.

Q6b.	How much of the overall expenditures of your group on training are for projects/programmes that span more than one country?
	%

Q7. Is it possible for you to give us the breakdown of your training expenditures across a number of product group categories--in percentage terms, and to indicate which areas are growing and which are shrinking?

	Types of training (products):	Current Percent	Future Growth
-	In-house training staff		
-	Facilities/Overheads		
-	Seminars/Conferences		
-	CoursesStandard		
-	CoursesCustomised		
-	Off-the-shelf materials		
-	Customised materials
