U.S. SOFTWARE PRODUCTS MARKETS, 1985-1990

ABSTRACT

This annual survey provides analyses and five-year forecasts of business-related U.S. software products markets for the period 1985-1990.

The forecast data base in this report includes market size and growth rates for both applications software and systems software products for mainframe/mini and micro software.

The five-year forecasts, which include 1984 as the base year, cover 20 different industry-specific and cross-industry markets for applications software products. Also included are market forecasts for three systems software products sectors-- applications development tools, data center management, and systems control.

This report identifies the factors behind the demand for these market segments. In addition, the fastest growing and largest markets are highlighted and analyzed, as are key issues, trends, and developments. Business and market strategy recommendations are provided for vendors interested in increasing their market penetration.

This report contains 227 pages, including 102 exhibits.

I INTRODUCTION

I INTRODUCTION

- This report is produced as one of a series of reports in INPUT's Software Markets Program, which is part of the Market Analysis and Planning Service (MAPS) for the Information Services industry.

A. PURPOSE OF THIS REPORT

- This report reviews and analyzes two important modes of the software market: mainframe/mini- and microcomputer-based software products.
- This report is designed to assist vendors in:
 - Identifying new markets and product opportunities.
 - Assessing product and marketing risk exposure.
 - Allocating R&D and operations resources.
 - Obtaining insights into market-related developments that impact profitability.
- Market analysis and forecasts of other information systems modes may be found in the following companion reports:

- Professional services are examined in an INPUT volume entitled Professional Services Markets, 1985-1990.
- Processing services and turnkey systems are analyzed in two other volumes entitled U.S. Processing Services Markets, 1985-1990 and U.S. Turnkey Systems Markets, 1985-1990.

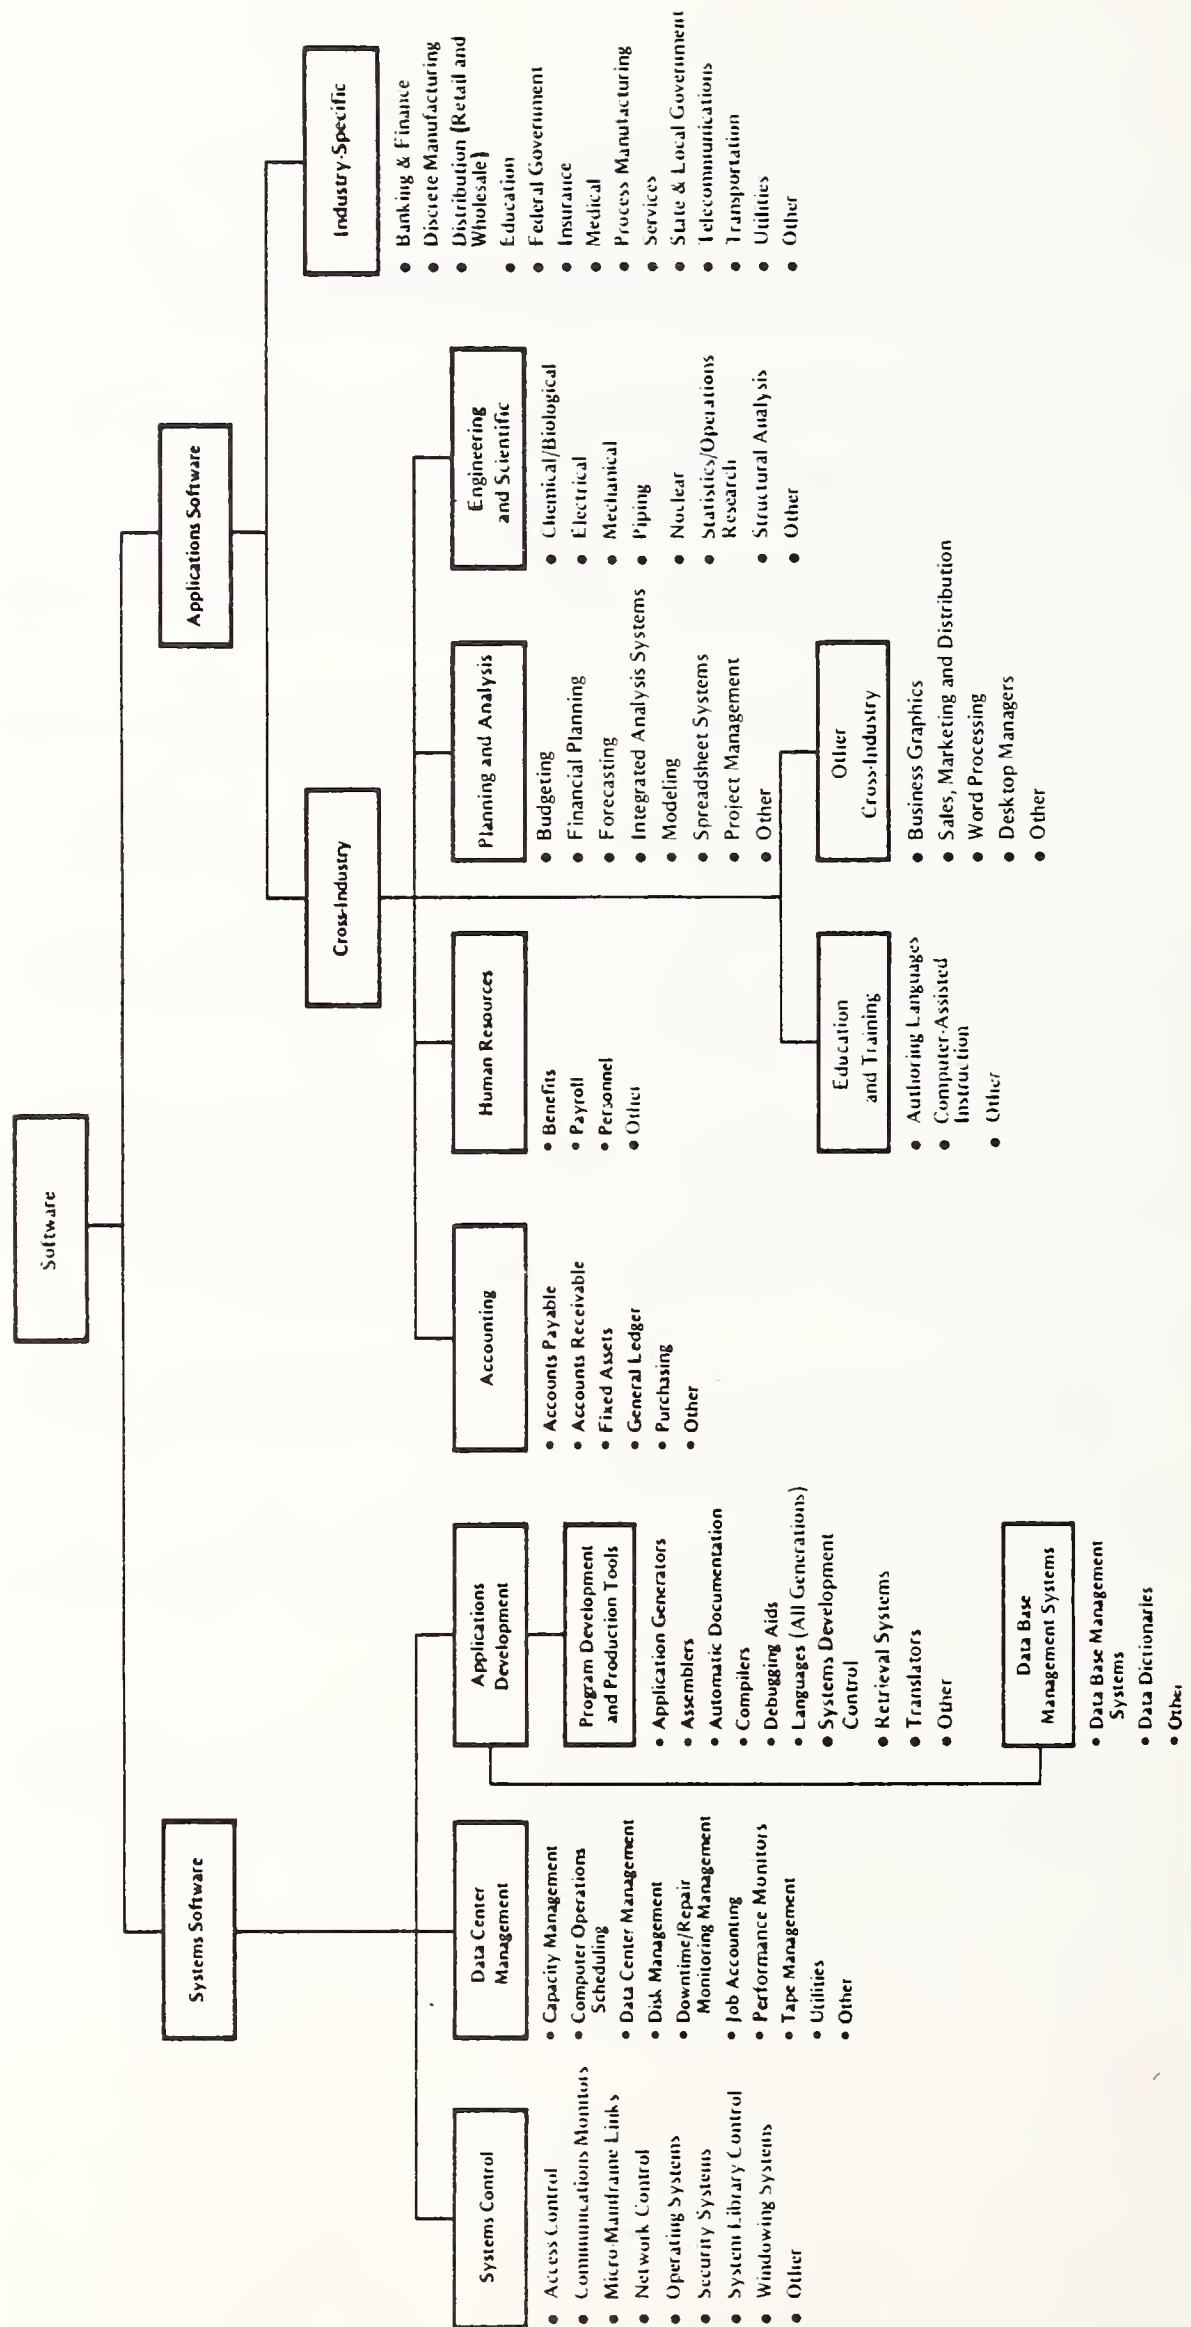

B. SCOPE AND ORGANIZATION

- This report focuses on U.S. markets and analyzes user expenditures that are noncaptive (i.e., dollars spent on services and products provided by organizations outside of the buyer's own corporate structure). Note that revenue dollars and expenditure dollars are not the same, especially in the micro segment. This is due to the use of distributors and dealers. Vendor micro software revenue in many cases is half the overall end-user dollar spent on software products.
- This report is organized as follows:
 - Chapter II is an Executive Summary provided in presentation format, complete with script.
 - Chapter III forecasts and analyzes software products in terms of opportunities and challenges, issues, and events. Market sizes and growth rates for the 1985-1990 timeframe for over 20 different major industry-specific and cross-industry applications software products market segments are provided together with data for systems software market segments.

- Chapter IV includes the major issues and trends that are directly impacting the software market and thereby influencing either positively or negatively its growth and structure.
 - Chapter V presents major competitive developments taking place in the industry and describes selected vendor actions.
 - Appendix A contains a set of definitions relevant to this report.
 - Appendix B contains a complete data base of the market sizes and growth rates discussed in this report, as well as a reconciliation of INPUT's 1984 software forecasts vis a vis this year's forecasts.
 - Appendix C lists other INPUT reports that are related to the software markets discussed in this report.
 - Appendix D includes a ranking and brief description of the 1984 major independent software vendors which was prepared by INPUT and published in September 1985 Software News.
- Exhibit I-I profiles the classification scheme used by INPUT to structure the software products marketplace.
 - Use of the term AAGR in the text of this report is an abbreviation for Average Annual Growth Rate.
 - INPUT welcomes comments and suggestions from its clients concerning the content and format of this report.

EXHIBIT I-1

SOFTWARE MARKET STRUCTURE

II EXECUTIVE SUMMARY

II EXECUTIVE SUMMARY

- This chapter summarizes key forecasts, issues, and trends that are discussed in more detail in the remainder of the report.
- This Executive Summary is prepared in a presentation format; i.e., the exhibits are set in larger type for ease of use with an overhead projector and the text is in script form. The script for each exhibit is contained on the left-hand page opposite the exhibit.

A. SOFTWARE PRODUCTS TO CONTINUE TO LEAD FIVE-YEAR GROWTH

- Software products will be the fastest growing segment of the information services marketplace for the period 1985-1990. From a base of over \$13 billion in 1985, software products will expand 25% annually. By 1990, they will emerge as a \$41 billion opportunity. There are several major driving forces that are stimulating this market.
 - The long-term growth of the hardware installed base. The main-frame/mini installed base is expected to be 3.2 million units in 1990, while in the same year there are expected to be 20 million micros. Consequently, there will not be a lack of "boxes" on which to run software.
 - Technology price/performance improvements. Improvements in hardware configurations such as networks will stimulate the sale of new types of distributed software. (Distributed systems are obsoleting almost every piece of software on the market today, thereby creating opportunity for new product sales.) The inclusion of AI in software packages will make them easier to learn and use, which will in turn increase sales.
 - The acceptance by top management of automation as a competitive edge. Once management is willing to invest money in automation, in many cases they will be unwilling to wait for internally developed solutions and will instead opt for packaged software. In addition, once end users are comfortable with simple computer applications, they will look for ways to be more creative/productive and hence will purchase more complex software.
 - Increased systems standardization such as communication protocols (and standards within industries). This important trend toward commonality will increase the potential sales base of most software vendors' products.

SOFTWARE PRODUCTS TO CONTINUE TO LEAD FIVE-YEAR GROWTH

B. WHY THE RECENT SLOWDOWN?

- The overall software market is experiencing a temporary slowdown. In 1983-1984, the software market increased by 34%, but then decreased to a 20% growth in 1984-1985. This slowdown is due primarily to:
 - The state of the U.S. economy that is placing budget constraints on companies and restricting software product purchases.
 - Purchaser confusion that is stemming from increasing competition from the large number of software vendors as well as the variety of product choices.
 - Fear by purchasers of product reliability due to highly publicized problems with several higher-priced software products. With fear comes caution, and thus a longer selling cycle.
 - The long installation time of large complex software systems that many companies opted to purchase in the near past has put a temporary hold on followup or add-on purchases.
- INPUT expects this market slowdown to be temporary, and as the aforementioned negative forces wane, the market will continue its healthy growth.

WHY THE RECENT SLOWDOWN?

- **State of Overall Economy**
- **Increased Competition**
- **Confusion**
- **System Failures - Credibility**
- **Absorption Bottleneck**

C. MAINFRAME/MINI SEGMENT CONTINUES TO EXPERIENCE CHANGES

- Mainframe/mini software products accounted for almost 80% of the overall software products market in 1985. With an AAGR of 23%, the market is expected to reach over \$30 billion by 1990. The changing character of this marketplace is heavily impacted by pricing and distribution channels.
- Mainframe/mini software products experienced a lower than expected growth rate over the past two years. INPUT expects that price levels for these products in general will increase approximately 4% over the next two years. This will be primarily due to increased user demand and management focusing again on company long-term strategy that will lessen price discounting.
- Mainframe software products have primarily been sold through direct sales; mini products through hardware vendors and VARs. Software product vendors will increasingly seek alternative distribution channels as a way of controlling their heavy marketing and sales expenses. New distribution channel opportunities that will exist include:
 - Using customers to sell systems, such as a bank selling a software vendor's cash management package to large corporate clients.
 - Selling the software products to either hardware or software product vendors to be imbedded in their products--an example is ADR selling their Datacom DB to applications software vendors for a more integrated product line.
 - And finally, and in many ways the most valuable distribution opportunity for software vendors in the future, licensing a product to IBM. An example of this is UCCEL's selling of UCC TWO (DUO) to IBM after marketing it by themselves for years.

MAINFRAME/MINI SEGMENT CONTINUES TO EXPERIENCE CHANGES

D. MICRO SOFTWARE MARKET TO SHOW HEALTHY FIVE-YEAR GROWTH

- In 1990, the installed base of micro hardware will be double what it is today-- 8.5 million units versus 20 million units. Consequently, there will be a more than two-fold increase in the number of repositories for software in five years. This means there will be no real shortage of hardware that needs software to be useful.
- In 1983-1984, user expenditure micro software growth was 120%. This annual growth decreased to 23% in the 1984-1985 period, primarily due to the very low dollar base of micro software in 1983 as well as industry consolidation-- the rich get richer and the poor leave the industry.
- The five-year average annual growth rate of 32% for this five-year period outpaces the 25% growth for the software market as a whole.
- By 1990, the annual expenditure for micro software will be four times larger in spite of the fact that the hardware base will only double. The micro software penetration will continue unabated as automation permeates all facets of U.S. business.
- Factors impacting this market are:
 - Technology price/performance improvements stimulating both hardware and software purchases.
 - Large corporations' acceptance of microcomputers as productivity enhancement tools.
 - The trend toward distributed data processing creating the demand for multiuser and networked micro software packages.

MICROCOMPUTER MARKET TO SHOW HEALTHY FIVE-YEAR GROWTH

*Average Annual Growth Rate

E. SYSTEMS SOFTWARE MARKET TO TRIPLE BY 1990

- The systems software market continues to experience healthy growth. In 1985, over \$6 billion was spent on systems software. With an expected 25% AAGR, almost \$20 billion will be spent in 1990.
- Of the 1985 user expenditures, approximately 57% was for mainframe packages, 31% for mini packages, and 12% for micro packages. By 1990, micro software will comprise 20% of systems software expenditures. This significant increase in micro software market share is a reflection of the more than doubled micro hardware installed base combined with high end-user interest in do-it-yourself applications solutions.
- The application development tool market will have the highest average annual growth rate (30%) of all the systems software segments for the period 1985-1990. The micro portion of the market will grow from 14% in 1984 to 23% in 1990. This will be due to a large increase in micro DBMS sales as well as to the proliferation of mainframe-based tools that will have fully compatible micro versions.
- The data center management market is expected to more than double within the forecast period. This growth is being fueled mostly by end-user computing and distributed data processing, both of which create more complex hardware combinations that require software for proper management.
- In 1990 the systems control market will account for over \$6 million in user expenditures as a result of a 23% AAGR. This will make the systems control sector in 1990 nearly as large as the entire systems software market in 1985. The increasing use of LANs and micro-mainframe links as well as the need for better data security will contribute significantly to the growth of this software category.

SYSTEMS SOFTWARE MARKET TO TRIPLE BY 1990

F. APPLICATIONS SOFTWARE INDUSTRY-SPECIFIC SEGMENTS TO INCREASE SIGNIFICANTLY

- The applications software market is expected to have the same AAGR 1985-1990 as systems software (25%). The mainframe/mini versus micro percent of the market is expected to remain almost constant at 70% versus 30%.
- The overall applications software market cross-industry segment will have a 19% growth during the forecast period, as opposed to the industry-specific segment that will have a 32% AAGR.
- This "tilt" toward industry-specific applications will be due to:
 - Maturing of the cross-industry market which has become more saturated.
 - Generally higher average unit price for industry-specific packages.
 - Management preference toward industry-specific solutions for automating "the heart" of the business.
- From a user expenditure perspective, rankings of the top three industry-specific segments in 1985 and 1990 will be relatively similar: banking and finance = 1; discrete manufacturing = 2; and medical = 3.
- Stimulants to these major markets include: deregulation and the ensuing increased competition in the banking and finance segment; strong competition from abroad forcing cost-effective solutions in the discrete manufacturing segment; and due to government pressure, the need to contain costs in the medical industry.

APPLICATIONS SOFTWARE INDUSTRY-SPECIFIC SEGMENTS TO INCREASE SIGNIFICANTLY

G. CONCLUSIONS

- The software market will continue to be a healthy market, but only for well-managed and well-financed vendors. Although 1985 was a year of lesser than expected growth, mid-to-late 1986 will be a time of renewed sales with a 28% growth expected between 1985-1986.
- Information systems (IS) managers are becoming increasingly "pro" software products. As top management views automation as a competitive edge, the pressure for "results now" favors software product licensing.
- Rapid product obsolescence will continue to occur during the next five years due to the impact of technology changes and aggressive vendor new product developments.
- Larger firms that are primarily in other businesses, but which have software affiliates, will continue to increase their share of the software market. This directly impacts most software-only vendors who will find it harder to compete without easy access to ever-increasing financial resources for product development and marketing.
- Expansion of product lines into new markets by software vendors is essential for growth but is complicated to manage. It will, however, be a key skill for the balance of the 1980s.

CONCLUSIONS

- **Overall Software Market Outlook Healthy**
- **I.S. Managers “Pro” Software**
- **Rapid Product Obsolescence**
- **Increased Competition by Large Non-Independent Vendors to Continue**
- **Expansion of Product Lines is Essential**

H. RECOMMENDATIONS

- To take advantage of the opportunities available in the software marketplace, vendors should:
 - Integrate product lines. Systems should be designed so they can be easily integrated with related applications either now or later.
 - Spend more effort tracking and evaluating new technology. Technology will continue to be a major factor in product differentiation and consequently its creative use will be a key to vendor success.
 - Be more aggressive internally with the use of systems development tools that can enhance the productivity of R&D efforts.
 - Evaluate alternate distribution channels, such as sub-contracting to system integration vendors who win large contracts for acquiring, combining, and installing complex hardware/software systems.
 - Emphasize customer service. Post-sales support is a major opportunity for vendors to acquire a predictable annual revenue stream as well as better satisfy customers who will then return for future products.
 - Be on the lookout for partners. Aggressively seek partnering activities, be they acquisitions, joint ventures, or R&D partners. This will help increase chances for sales opportunities, especially in markets where the window of opportunity is narrow.
 - Focus on recurring revenues. Place more emphasis on monthly rather than up-front, one-time payments. This increases vendor financial stability plus helps stimulate sales to buyers with short-term budget pressures.

RECOMMENDATIONS

- **Integrate Product Lines**
 - **Track and Utilize Emerging Technology Early**
 - **Evaluate Alternative Distribution Opportunities**
 - **Emphasize Service**
 - **Aggressively Look For Partnering Activities**
 - **Develop Recurring Revenue Stream**
-

III MARKET SIZE AND GROWTH

III MARKET SIZE AND GROWTH

A. MARKET FORECASTS

I. OVERALL MARKET, 1985-1990

a. Overview

- Software products is the growth star of the 1985-1990 information services marketplace. From a base of over \$13 billion in 1985, software products will outperform all other modes by expanding 25% annually. By 1990, it will emerge as a \$41 billion opportunity, thus making software products larger than the entire information services market in 1985 (see Exhibit III-1). *almost as large as the*
- From an historic perspective of the information services industry, the software market was 8% in 1970 and is expected to grow to over 30% by 1990--doubling in market share every 10 years (see Exhibit III-2).
- In 1990, the information services offerings by computer/communications hardware firms and subsidiaries of larger companies will more than double. In 1985, information services revenue by these companies was over 10% of total. In the software market specifically, these types of suppliers will go from almost 50% of the market in 1985 to almost 70% in 1990.

SOFTWARE PRODUCTS MARKET FORECAST: 1985-1990

SOFTWARE PRODUCTS PORTION OF INFORMATION SERVICES (1970-1990)

Software Products	\$0.3	0.7	2.9	13.3	41.2
Total Information Services	\$3.2	5.7	17.0	48.6	122.2

- The active participation of hardware vendors in the systems software market is a major force behind these market shares.
- An example of the aggressiveness of one industrial segment--telecommunications vendors--is Ameritech's acquisition of ADR in late 1985, the largest software product company acquisition in history.
- In 1984, of total user expenditures, 47% were for mainframe products, 33% were for mini products, and 20% were for micro products. In 1990, the micro portion of the market is expected to be almost 27% of the overall software market, due primarily to the large increase in microcomputers in business and more sophisticated users purchasing more complex and higher priced software products (see Exhibit III-3).
- Vendors with more than \$10 million in revenue accounted for about 65% of user expenditures in 1984. This percentage for large vendors will tend to increase as the software products market continues to mature.
- Both applications software and systems software segments are expected to have healthy 25% average annual growth throughout the forecast period (see Exhibit III-4). In the sections to follow, more specific analysis will be provided for both market segments.

b. Driving Forces, 1985-1990

- There are several major driving forces that are stimulating the growth of the overall software industry.
 - Since software needs hardware on which to run, the growth of the hardware installed base over a multi-year period has a major direct impact on software sales. In 1990, there are expected to be 3.2 million mainframe and minicomputers installed. In the same year, the micro installed base will reach 20 million units.

**SOFTWARE PRODUCTS MARKET FORECAST,
MAINFRAME/MINI AND MICRO: 1985-1990**

**APPLICATIONS VERSUS SYSTEMS SOFTWARE
MARKET GROWTH: 1985-1990**

- Technology price/performance improvements will affect both software and hardware products. Networks and the inclusion of AI in software products are just two of the technological advances that will impact softwares sales in a positive way.
- Top management is coming to view automation as a competitive edge. Once management comes to this conclusion, impatience will occur and in many cases they will be unwilling to wait for internally developed solutions, instead purchasing packaged software.
- End-user computing demand affects software sales in every segment of the industry. Once people are comfortable with simple computer applications, they will look for ways to be more creative/productive and hence will stimulate the demand for more complex as well as a larger number of overall software packages.
- Increased systems standardization will increase the potential sales base of most software vendors' products. Vendors must be attuned to these evolving standards when designing or integrating products.
- Distributed systems are obsoleting almost every piece of software on the market, thereby creating opportunity for new product sales.

c. Causes of Recent Slowdown

- The overall software market has experienced a slowdown in rate of growth as seen in Exhibit III-5. In 1983-1984, the software market increased by 34%, then decreased to a 20% growth in 1984-1985. This slowdown is due primarily to:
 - The state of the economy that is placing budget constraints on companies and restricting software product purchases. In many cases,

EXHIBIT III-5

SOFTWARE PRODUCTS GROWTH: 1981-1985

companies are opting to "live with" previously installed systems or do internal development with existing resources rather than purchase products from the outside.

- The increasingly aggressive competition from the large number of software product vendors as well as the multiplicity of product choices are creating confusion for potential purchasers and thereby increasing the selling cycle.
 - Problems with the reliability of some higher priced software products have made purchasers wary of other large ticket items.
 - In the recent past many companies purchased large complex software systems. The extensive amount of time needed to install these systems has put a hold on followup or add-on purchases.
- INPUT expects this market slowdown to be temporary and, as the aforementioned negative forces wane, the market will continue its healthy growth. Exhibit III-6 shows growth per year increasing after the 1984-1985 period.

d. Hardware Vendors versus Independents

(i) Hardware Vendors

- In 1984, hardware vendors accounted for over 36% of the total software user expenditures. Viewed by software product type, these vendors were distributed as follows:
 - Thirty-eight percent mainframe software dollars.
 - Forty-four percent mini software dollars.
 - Eighteen percent micro software dollars.

EXHIBIT III-6

ANNUAL SOFTWARE PRODUCTS MARKET GROWTH

	1984	1985	1986	1987	1988	1989	1990	AAGR 1985-1990
\$ Billions	\$11.1	13.3%	17%	22%	27.6%	33.9%	41%	-
Percent Growth Per Year	34%	20%	28%	29%	25%	23%	22%	25%

- These percentages highlight the differing competitive structures of the software industries that will be elaborated on in sections to follow.

(ii) 1984 Leaders

- In 1984, the top 10 software leaders accounted for 37% of the overall vendor revenue. This number includes only those revenues received by publishers, not those received by distributors or retailers. Exhibit III-7 lists the leading vendors and market share.

- To be noted is the large market share by IBM. The company has stated its intent to have 40% of their overall corporate revenue in 1990 be from software products.

- This would mean that IBM would receive \$40 billion in software revenue worldwide (about \$30 billion for U.S.).

- This revenue, according to INPUT's software products forecast, would mean that IBM would have 73% of the U.S. market in 1990. INPUT does not support this projection. More likely for the computer giant is a 40-45% share by the end of the decade. INPUT does believe IBM software product market share will increase, but not from 23% in 1984 to 73% by 1990.

- There were two mainframe and two micro software independents included in the top 1984 vendor list. The mainframe vendors (Cullinet and MSA) are well established vendors while the micro vendors (Lotus and Microsoft) have been market players for only about three years. As the industry continues to consolidate, newer players to the market, unless they are extremely well-managed and financed, will not be as likely to gain Top 10 ranking.

EXHIBIT III-7

SOFTWARE PRODUCT LEADERS, 1984

RANK	COMPANY	VENDOR REVENUES (\$ Millions)	MARKET SHARE (Percent)
1	IBM	\$2,250	23%
2	NCR	250	3
3	Hewlett-Packard	230	2
4	DEC	210	2
5	Burroughs	180	2
6	Cullinet	144	1
7	Lotus	140	1
8	Sperry	130	1
9	Microsoft	123	1
10	MSA	120	1

Total 1984 Software Product Vendor Revenues = \$10,000 Million

Top 10 = 37% of Market

(iii) Public Software Product Companies

- The 27 public software companies included in INPUT's Vendor Financial Watch sample in Exhibits III-8 and III-9 accounted for 17% of the revenues of the software industry in 1984.
- Exhibit III-10 highlights the cooling of the industry during last quarter 1984 and first quarter 1985 by revenue and net income growth. Second and third quarter 1985 do, however, show a beginning of an industry recovery.
- This recovery trend shows that although software product vendors have had a rough 1985, the cost containment strategies most have implemented, as well as the easing of the aforementioned negative industry factors, have strengthened the remaining viable vendors in the industry and are helping to prepare them for continued growth.

e. Mainframe/Mini/Micro

(i) Mainframe/Mini

- Mainframe/mini software products will account for almost 80% of the overall software products market in 1985. With an AAGR of 23%, the market is expected to reach over \$30 billion by 1990 (see Exhibits III-11 and III-12).
- In contrast to the micro software vendors, mainframe/mini sellers are characterized by:
 - More stable, well established organizations.
 - More experienced management.
 - More control of distribution channels (via direct sales).

EXHIBIT III-11

MAINFRAME/MINI SOFTWARE EXPENDITURES
U.S. BUSINESS

EXHIBIT III-12

MAINFRAME/MINI SOFTWARE MARKET
1985-1990

- More direct and frequent customer contact.
 - Selling of solutions that are often transaction processing oriented and tend to automate the "heart of the business."
 - More financial resources.
- These vendor company traits are characteristic of a consolidated, reasonably mature industry with well known, established industry leaders who have a high degree of stability.
 - The leading mainframe and mini software vendors in 1984 are listed in Exhibits III-13 and III-14.
 - There are three hardware vendors in the top 10 mainframe list while in the mini list hardware vendors account for the entire list of leaders.
- This hardware vendor-skewed mini market is primarily due to the fact that these vendors provide operating systems, DBMS, and other types of systems software that have less competition from independent vendors than occurs in the mainframe market.
 - For another market perspective, Exhibit III-15 highlights independent mini leaders 1984. The top vendors, however, account for only 10% of the independent mini vendor market in 1984. This is primarily due to the fact that most applications on minis are for small businesses and are generally industry-specific in nature. Consequently, the economies of scale are not there for major hardware vendors to participate in these markets with specialized applications.

(ii) Micro

(a) Hardware

- As previously mentioned, micro hardware is the fundamental driving force of the software industry since it increases the base of potential users.
- In 1990, there is expected to be more than 40% penetration of the potential business users. Consequently, there were 42 million possible computer purchasers in 1985. This number of potential purchasers will increase to 46 million in 1990, meaning that microcomputer growth opportunities will continue into the next decade.
- The average microcomputer in 1985 costs about \$3,000 fully configured. In 1990, INPUT expects a system to cost about the same or slightly less except that it will come standard with more functionality. Included in a typical 1990 system will be a high-resolution color monitor, optical disk, more expensive 80386 or such microprocessor, etc. (see Exhibit III-16).
- Despite the sorry state of vendor earnings in 1985, the overall picture of micro hardware as it affects software sales (installed boxes) is good. All major vendors had increased hardware shipments in 1985.
 - IBM sales were up about 20%.
 - Compaq sales were up about 50%.
 - AT&T sales were up over 100%.
 - Apple sales were up 27% for fiscal year ending September 1985.
 - Zenith sales were up significantly.

(b) Software

- In 1984, over \$2 billion was spent on micro software of all types. That averages out to about \$300 per installed CPU. In 1990, almost \$11 billion is expected to be spent on software or about \$500 per CPU. Higher software expenditures per CPU is expected in spite of decreasing software prices since:
 - More complex software will be purchased for LANs and distributed data processing (DDP) environments at a higher price.
 - More sophisticated users will be willing to purchase a larger number of packages per system.
- In 1983-1984, user expenditure software growth was 120%. For 1984-1985, this growth decreased to 23% (see Exhibit III-17). There is still a 23% growth which is considered healthy in most industries (and is about the same growth rate as mainframe/mini software). Due to an AAGR of 32% by 1990, the annual expenditure for software will be four times larger than 1985 in spite of the fact that the hardware base will only double.
- Exhibit III-18 divides the micro software market into its major segments. The five-year AAGR of these segments varies greatly, and each will be discussed in depth in the following sections.
- From a software company perspective, in 1984 companies with revenue over \$10 million accounted for about 70% of the \$2.2 billion market. Viewed from another perspective, the top 10 micro software vendors accounted for over 60% of the 1984 market (see Exhibit III-19).
 - This highlights the consolidation in the industry resulting in fewer leading vendors and more difficulty for new companies to break into the markets of these existing leaders.

- Many smaller vendors will choose to sell the rights to their products to larger vendors rather than fight.

2. SYSTEMS SOFTWARE

a. Market in General

- As shown in Exhibit III-20, systems software is used to control computers, manage data centers and networks, and develop applications.
- There have been and will continue to be definitional problems in the systems software area as the functional boundaries and capabilities of information systems continue to change. For example, as integrated applications (i.e., a combination of DBMSs and associated application(s)) become increasingly important, identifying technical and market boundaries will become more difficult. Currently, INPUT classifies spreadsheet-graphics-word processing-DBMS types of systems (e.g., Symphony and Framework) as cross-industry applications software within the planning and analysis market segment since this is the primary use of this type of system.
- The systems software market continues to experience strong growth. In 1984, over \$5 billion was spent on systems software. With an expected 25% AAGR for 1985-1990, almost \$20 billion will be spent in 1990 (see Exhibit III-21). In 1984, systems software accounted for 48% of the overall software market; in 1990, this segment is expected to be about the same percentage, thus reflecting the equilibrium in demand for both "solutions" (applications software) and tool and aids which support these solutions (systems software).
- Of the more than \$6 billion in user expenditures in 1985 for systems software, approximately 57% was for mainframe packages, 31% for mini packages, and 12% for micro packages. The higher percentage of dollars for mini and mainframe packages is not surprising in that products for these systems have a higher average unit price and systems software products have been available on these systems for a longer time than for micros.

SYSTEMS SOFTWARE PRODUCTS
MARKET STRUCTURE

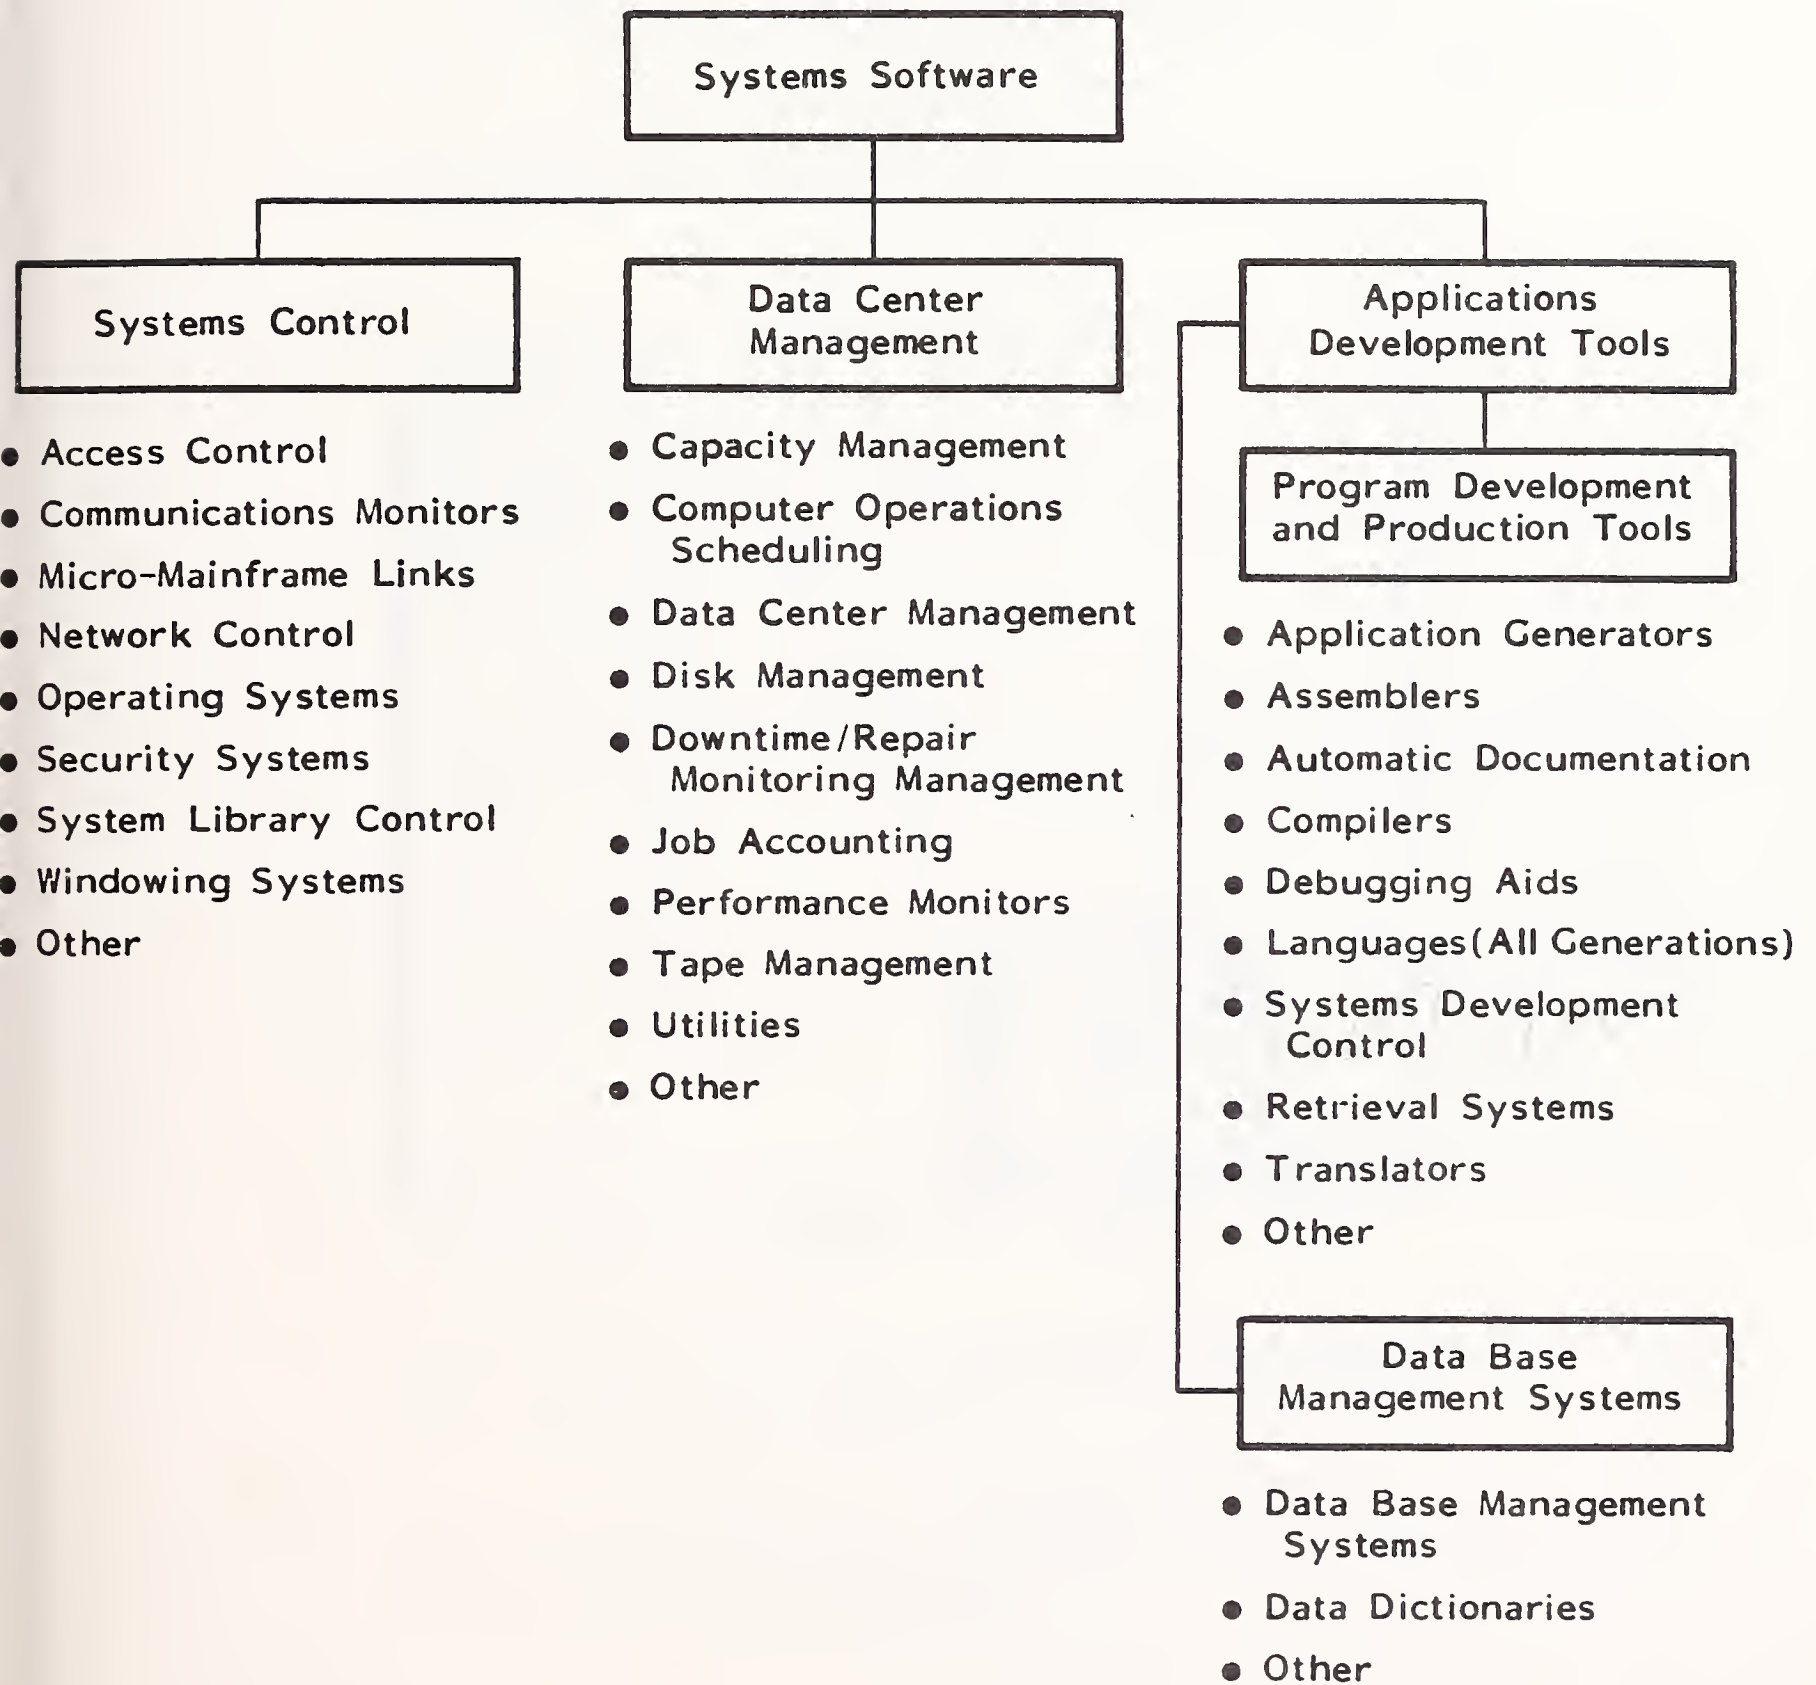

EXHIBIT III-21

SYSTEMS SOFTWARE MARKET, 1985-1990

*Average Annual Growth Rate

- In the systems software market in 1984, hardware vendors accounted for 47% of total user expenditure. The major segment that these vendors derive revenue from is systems control due to vendor-supplied and often proprietary operating systems.
 - Viewed from the three major hardware size categories, hardware vendors provided 45% of mainframe system software dollars, 61% of mini dollars, and only 19% of micro dollars.
 - IBM is the only major hardware vendor that provides a significant amount of micro systems software (primarily the PC-DOS operating system). Since the average revenue to IBM per system is relatively small, IBM's overall micro system software revenue, and consequently the revenue of hardware vendors as a whole in this micro segment, is relatively small.
 - Independent vendors that provide micro DBMS and languages accounted for most of the micro systems software user expenditures in 1984.

- Vendors with revenue over \$10 million accounted for 72% of the overall \$5 billion in 1984. Again, well-established independent as well as hardware vendors made up this percentage. Product type breakdown is as follows:
 - Vendors with revenue over \$10 million accounted for 73% of mainframe systems software user expenditures.
 - Vendors with revenue over \$10 million accounted for 66% of mini systems software user expenditures.
 - Vendors with revenue over \$10 million accounted for 85% of micro systems software user expenditures.

- Leading systems software vendors and their market share for 1984 are listed in Exhibit III-22. Since IBM has such an overwhelming percentage of the market, Exhibit III-23 is provided listing the top 10 independent (non-hardware) systems software vendors and market share. Of the top 50 independent software vendors in 1984, 24 of the 50 received the majority of their revenue from systems software. The fact that in 1983 only 18 of the top 50 were categorized as systems software vendors is a further reflection of viability of the systems software marketplace in spite of the abundance of applications solutions that are "ready to go."
- Exhibits III-24, III-25, and III-26 provide the top 10 vendors and market shares by system type. In all but micro systems software, IBM is the leader by a wide margin. In micro software, however, IBM has as yet not been as aggressive as in other markets. Thus, several independent vendors have gained significant market dominance. In the mini segment, the top 10 vendors are all hardware manufacturers but one (Cognos), since most mini vendors provide their own proprietary operating systems as well as "office solutions" such as DBMS, tools, and connectivity. The mini applications software market in comparison is dominated by independent vendors, mostly VARs or small private companies.

b. Forecasts

- As previously mentioned, the systems software market is expected to grow well during the forecast period.
 - The mainframe/mini segment, which accounts for 88% of user expenditures in 1984 but will decrease in market percentage to 79% in 1990, will have an AAGR of 23% (see Exhibit III-27).
 - With the growth of micros and their increasing usefulness as productivity tools, rapid systems software expansion will occur. Starting from a much smaller base than systems software products for larger

systems, the micro segment will have a 42% AAGR from 1985-1990 (see Exhibit III-28).

- A major driving force that especially impacts the systems software market is the increasing trend toward incorporating systems software in applications (see Exhibit III-29). This will stimulate systems software sales and make applications packages more attractive purchases.

c. Application Development Tools

(i) Forecasts

- The application development tools market will have the highest 1985-1990 growth rate of all the systems software segments at 30% (see Exhibits III-30, III-31, and III-32). The micro portion of the market will grow from 14% in 1984 to 23% in 1990. This will be due to a large increase in micro DBMS sales as well as many successful mainframe packages that will have equivalent full function micro packages--especially fourth generation languages--for both programmers and end users. An example of this is PC Focus by Information Builders.
- End-user computing demand will be the major growth stimulus for this market. End users will increasingly demand more and more tools to access information or create systems. They will realize that many off-the-shelf applications packages will not satisfy their specific needs and will resort to fourth generation languages either on host or micros to build or rework programs. Retrieval tools will also be easier to use and be more accessible to non-programmers.

(ii) DBMS

- A DBMS is becoming fundamental to almost every application area that exists today; consequently, the overall growth of the DBMS market will continue.

EXHIBIT III-32

MICRO SYSTEMS SOFTWARE MARKET
BY SOFTWARE TYPE, 1985-1990

* Average Annual Growth Rate

- IBM's DB2 is already increasing in user acceptance, and there is an increased acceptance overall of relational data bases with improved performance; i.e., speed such as that found in ADR's product.
- Natural language interfaces are making it easier to query both mainframe/mini as well as micro DBMS products.
- INPUT projects that IBM's primary emphasis for the remainder of the 1980s (or IBM's SNA/DDP strategic period) will be on the following:
 - Continued emphasis upon highly centralized host control through SNA, operating systems, and DBMS.
 - Control of distributed processing and data bases.
- IBM impact on the mainframe DBMS marketplace is expected to be significant (see Exhibit III-33).
- While DBMS revenues will still represent only a small percentage of IBM's total revenue, INPUT believes DBMS will be the key to IBM's account control and to its all-important mainframe and magnetic storage sales.

(iii) Penetration Analysis

- From a penetration analysis perspective, the applications development tools market growth again is impressive. Mainframe/mini analysis is presented in Exhibit III-34.
 - In 1984, \$1,400 was spent per mainframe/mini CPU with over double that expected to be spent in 1990. This highlights the increasing number of tools that will be in use for programmers as well as for end users.

DBMS: KEY TO IBM CONTROL & GROWTH?

MARKET	\$ Billions	
	1984	1990
• Total IBM Revenue	\$46.0	\$100.0
- IBM Software Revenue	2.4	18.0
• Total DBMS Market	1.0	6.4
- IBM DBMS Share	.6	3.6
- Non-IBM DBMS Share	.4	2.8

**APPLICATION DEVELOPMENT TOOLS
PENETRATION ANALYSIS: MAINFRAMES/MINIS**

- From 1984 to 1990, the installed base of micros is expected to double. During the same timeframe the number of dollars spent per CPU on micro applications development tools is expected to quadruple (see Exhibit III-35). In spite of this large increase in CPU/dollar comparison, it should be noted that the mainframe/mini market for application development tools in 1990 will be twice as large dollarwise as the micro market.

(iv) Leading Vendors

- In spite of the fact that from a market share perspective, IBM has the market lead in the applications development tools segment, several large independents also have significant market share. This is due to strong DBMS product sales primarily in the mainframe market by leading independent vendors (see Exhibit III-36).

d. Data Center Management

- There are two broad types of data center management software products:
 - Products that optimize a machine's internal resources.
 - Products that help increase the productivity of the entire computer center.
- The data center management segment is expected to more than double within the forecast period (see Exhibit III-30, III-31, and III-32).
 - The micro segment will experience significant growth (AAGR 74%), but this is primarily due to 1985 user expenditures forming a low base.

**APPLICATION DEVELOPMENT TOOLS
PENETRATION ANALYSIS: MICROS**

EXHIBIT III-36

Top 10 = 55% of Market

* Includes distribution revenue; see page 2

- Ninety-four percent of user expenditures for data center management will be mainframe/mini product related, the balance (6%) micro related.
- As micros become more complex and interconnect, firms will require additional overhead of software, services, and people to coordinate their use. This will help fuel data center management growth.
- Micros now costing \$3,000 in many cases will be replaced within the forecast period by more sophisticated, multiuser systems (more than \$10,000) driving terminals.
 - Consequently, management of these computing resources will become an issue. Individual departments within a corporation will become "mini" DP departments.
 - As LANs increase in importance, keeping track of files, scheduling, and backup will all become major issues that data center management products address.
- From a vendor perspective, most major independent vendors will retain or increase market share due to quality products and name recognition (see Exhibit III-37 for 1984 market share). There will, however, be a need for products that run on micros (in this market there are no entrenched leaders) creating opportunities for vendors of products for larger systems as well as for lesser known vendors.

e. Systems Control

(i) Market in General

- In 1990, the systems control segment will account for over \$6 ^{billions} million in user expenditures as a result of a five-year 23% AAGR. This will make the

EXHIBIT III-37

Total Data Center Management Software Product Market = \$1,200 Million

Top 10 = 45% of Market

systems control sector in 1990 nearly as large as the systems software market in 1985.

- In 1985, the mainframe/mini segment of this market accounted for 90% of the user expenditures (micro 10%). In 1990, the mainframe/mini share of the systems control segment is expected to decrease in percent of expenditures to 75% while the micro share increases to 25%.
- The increase in micro share can be attributed in most part to the micro shipments of systems with more functional and more expensive operating systems (see the following section on micro operating systems) as well as to the incorporation of micro-mainframe links and LANs on new and existing micros.
- Both the mainframe/mini and micro segments will, however, have healthy growth rates during the forecast period.

(ii) Vendors

- From a 1984 vendor perspective, the top 10 vendors accounted for almost 70% of the market (see Exhibit III-38). Eight of the top 10 were hardware vendors.
 - This is not surprising since the largest component of this segment is operating systems for which most hardware vendors provide their own proprietary products.
 - INPUT expects this vendor segmentation to change in the coming years, however, as independent vendors provide connectivity tools as links in the overall office environment.

EXHIBIT III-38

Total Systems Control Software Product Market = \$1,800 Million

Top 10 = 69% of Market

* Includes distribution revenue; see page 2

(iii) Stimulus Factors

- Factors that serve to stimulate systems control software growth include:
 - The acceptance of connectivity in the office systems marketplace-- through micro-mainframe links, LANs, PBX, and multiuser systems.
 - More demand for systems security to protect the data in this increasingly on-line environment.

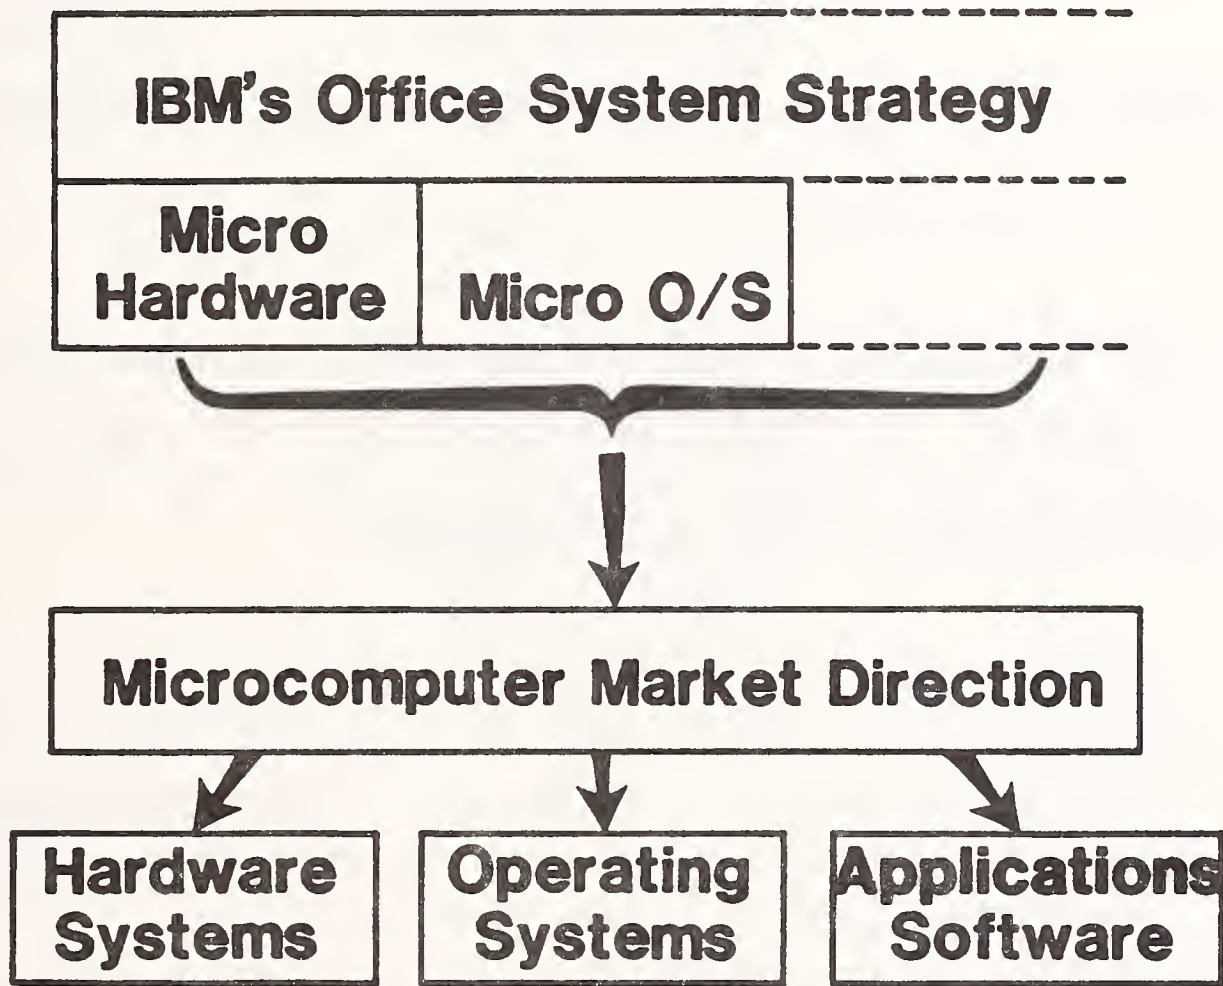

(iv) Operating Systems and Micro-Mainframe Links

- The following discussion of two segments of the systems control market-- micro operating systems and micro-mainframe links--are extractions from the executive summaries of two INPUT MAPs 1985 studies by the same name. These sections are provided to give the reader relevant market data regarding these volatile markets "at his/her fingertips," but in no way cover the markets as comprehensively as the original studies.
- In order for the applications software market to develop, an operating system (OS) standard must be available to serve as the foundation for families of software products with compatible files and command structures. Knowing which operating system will emerge as the dominant standard is therefore crucial since it conditions the ultimate success of the hardware it drives and the applications it supports.
- Multiuser, multitasking, shared-file, and interconnected personal processing are the new markets that await development, and those needs must be supported by high-performance operating systems that integrate all of the supporting functions needed by these very different components.

- IBM's strategy:
 - IBM's decision in 1981 to enter the microcomputer industry has affected the entire small system market immensely. The company offered a microcomputer product (the IBM PC, with an 8088-8/16 bit chip) more capable than competitors' with an open operating system to encourage development by third-party vendors of a large applications software base. In 1983-1984, IBM took over the business micro-computer marketplace.

- IBM's goal is to structure the office environment around the systems network architecture (SNA) and to assure the increasing demand for mainframe MIPs. Networked microcomputers as intelligent workstations linked to mainframes are a significant part of this strategy. Consequently, an operating system for microcomputers that provides these capabilities is a mandatory step for the company to take (see Exhibit III-39).
 - INPUT believes IBM will port a version of its mainframe operating system (VM) down to the microcomputer level for its high-end PC products. This proprietary operating system will help the company achieve absolute market dominance and reinforce the dependence on SNA. INPUT believes this proprietary microcomputer operating system, targeted for general business microcomputers, could be introduced as early as 1986.
 - Most IBM PC/AT-type products and above are expected to have multiple operating systems running as guests under VM. This would include an enhanced version of PC-DOS (multiuser, multitasking) and perhaps a third choice, such as UNIX. The PC-DOS operating system would allow the usage of PC-DOS applications software from the large installed base. The inclusion of other operating systems would depend upon uniqueness of applications packages for that environment as well as the tools for program modification or development available under that specific operating system.

**IBM's OFFICE SYSTEM STRATEGY DEFINES
THE OPERATING SYSTEM MARKET**

- IBM's microcomputer products, based on IBM's operating system (PC-DOS and proprietary), will continue to have healthy growth rates.
- As the decade continues, both large and small businesses will consider their computers more as necessities than as luxuries. Consequently, they will continue to turn to established companies for microcomputers--companies that can provide quality service and support and will remain in business to provide future compatible product upgrades and enhancements. The overwhelming choice for vendor will be IBM.
- Exhibit III-40 shows there will be secondary growth market opportunities for MS-DOS IBM compatibles, as well as for products based on major vendors' (i.e., Apple, Commodore) proprietary operating systems.
- Small businesses will be the main segment for these products since they are more price conscious than are large businesses, and the products will be lower in price than IBM products. "IBM consciousness" is not as well entrenched in small business as in large.
- UNIX, due primarily to AT&T marketing thrust, will become a significant operating systems market player in 1986-1987 in multiuser environments; however, its market share will decrease significantly by decade's end as UNIX's major selling points (multiuser, multitasking, programming utilities) will be incorporated in one of IBM's new operating systems. UNIX will remain a market alternative, but, as with proprietary vendors, will be more successful in small business markets than in large.
- The present micro-mainframe link marketplace is in a state of confusion, making link purchasing difficult for IS. Consequently, shipments of link products have been low; only about 150,000 micros were linked directly to mainframes in 1984 (see Exhibit III-41).

*Excludes IBM

EXHIBIT III-41

MICRO-MAINFRAME LINK MARKET CONFUSION

- Lack of Standards
- Enormous Price Variance
- Products Are Complicated and Do Not Provide a "Total Solution"

- There is an absence of communication and operating system (OS) standards, and although the general consensus that the IBM sets the corporate standard, establishing standards takes time.
- There is also no standard micro-mainframe product. Products range from low-end terminal emulators to sophisticated high-end products. Prices range from \$1,000 to \$75,000, depending on the product and number of microcomputers linked.
- Most link products require IS involvement. "Packaged" links must often be customized for specific corporate data bases and applications. Nontechnical end users find that the accessing of host data is complicated and impedes user productivity.
- INPUT believes connectivity is a very significant office trend. Seventy percent of all microcomputers in business are expected to be linked; however, micro-mainframe is only one way to provide the connectivity. Other ways include LANs, CBXs, and multiuser systems.
- In 1984, only about 3% of the microcomputers installed in business were physically linked to in-house hosts. In 1990, about 12% are expected to be physically linked, with another 9% being linked on a more "casual" basis via modem and communications software.
- INPUT projects that in 1990, 85% of the microcomputers in business will be used for analytical (primarily spreadsheet) type functions and 15% for operational processing tasks such as manufacturing and production. Modem links and LANs will be the connectivity methods which predominate for these analytical functions. Direct micro-mainframe linkage will probably be the connectivity method employed by operational workers (e.g., data entry, programming personnel) who need to access host data on a timely, ongoing basis (see Exhibit III-42).

OFFICE CONNECTIVITY

**Business Microcomputer Installed Base
1984-1990**

-  Linked via Emulator
-  Linked via Hardwired ROM (e.g., IBM PC/3270)
-  Linked via Modem-Communication Software

- Industry trends such as technology growth and IBM strategy impact the micro-mainframe market.
 - . Technology changes, such as VLSI circuits, will impact the micro-mainframe market both positively and negatively. Easier user interfaces and transparent host access will be developed. Increased chip capability will also provide greater memory storage and processing abilities, enabling much of the data now stored only on a host to reside permanently on a microcomputer.
 - . IBM's micro-mainframe link approach will redefine the distributed processing hierarchy and eliminate high-performance minicomputer systems operating under reasonably efficient operating systems such as UNIX. Large mainframes will provide centralized control of the network and distributed data bases. Intelligent workstations (microcomputers) will handle program development and maintenance as well as simple transaction processing against personal data.
- This push-pull from all corners, coupled with the trend toward distributed data processing (DDP) using LANs and multiuser systems, will limit the micro-mainframe market to a 27% AAGR from 1984-1990 (see Exhibit III-43).
- Micro-mainframe market trends include:
 - The micro-mainframe linkage market will continue to have significant growth, but does not offer broad opportunities to a large number of present and future participants. 1984 market leaders gained their positions due primarily to early market entry and can in no way be considered established leaders. The number of market participants will increase in 1985-1986, but by the end of the decade will level out to a

MICRO-MAINFRAME LINKAGE GROWTH

manageable number of known leaders, primarily involved in joint ventures to produce, distribute, and market micro-mainframe linkage products.

3. APPLICATIONS SOFTWARE

a. Market in General

(i) Overview

- Exhibit III-44 presents an overview of the applications software products market structure.
- The applications software market is expected to have the same 25% 1985-1990 AAGR as systems software (see Exhibit III-45). The mainframe/mini versus micro percent of the annual market size is expected to remain almost constant for 1985-1990. This is in contrast to the systems software market in which micros are 12% of the market in 1985 and will be 21% of the market in 1990. This increase is primarily due to the proportionally higher sales of sophisticated application development tools in the micro systems software segment.
- Of the overall \$5.7 billion in applications software user expenditures in 1984, 38% was for mainframe packages, 35% for mini applications, and 27% for micro applications. This contrasts to the systems software market where the proportions are: mainframe, 57%; mini, 31%; and micro, 12%. In the micro area the prime usages have historically been cross-industry applications. Systems software products have been limited to a small number of packages per CPU, in contrast to micro applications software, which have significantly more sales units per CPU, offer a greater variety of solutions for the typical user, and thus result in more user expenditures per CPU.

SOFTWARE MARKET STRUCTURE

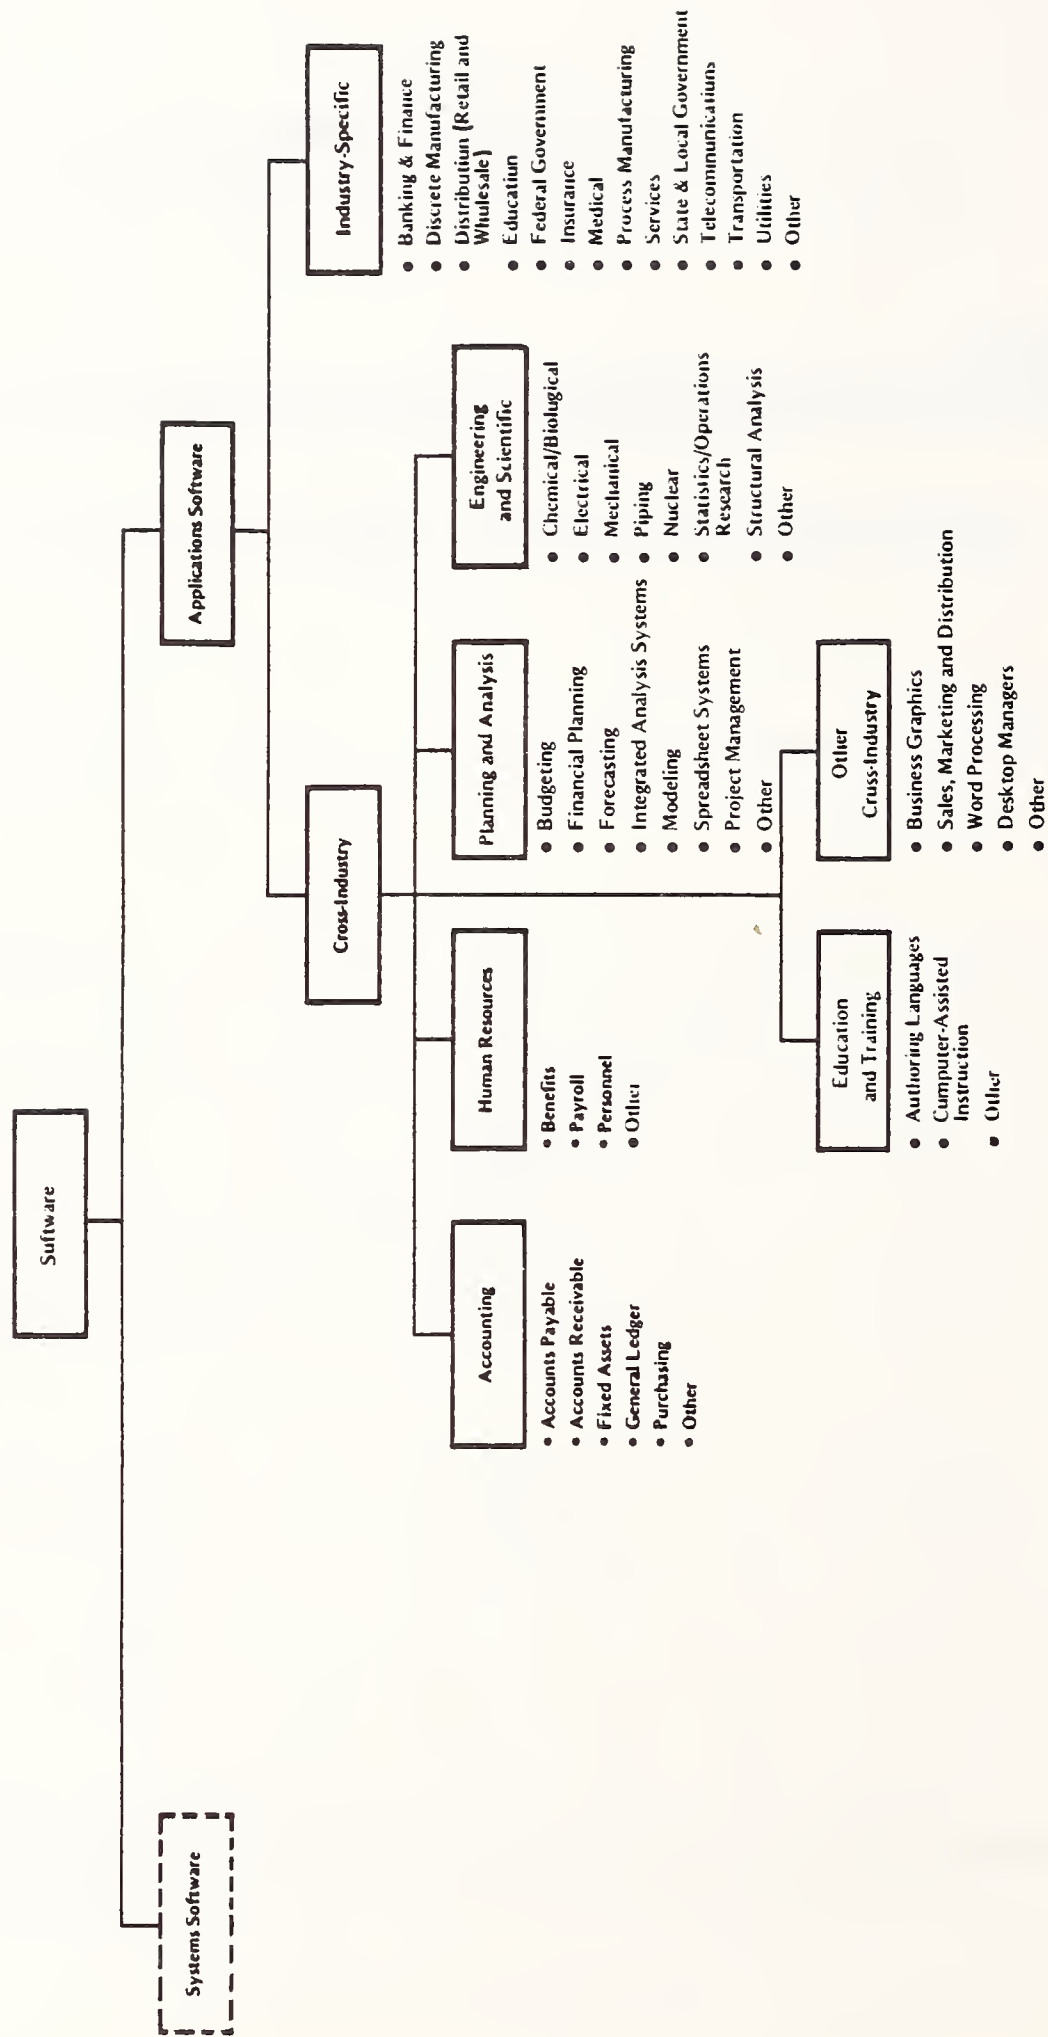

EXHIBIT III-45

APPLICATIONS SOFTWARE PRODUCTS MARKET, 1985-1990

*Average Annual Growth Rate

(ii) Hardware Vendors

- In the applications software products market in 1984, hardware vendors accounted for 27% of user expenditures. This contrasts with the systems software market in which hardware vendors accounted for 47% of the user expenditures. The higher dominance of this latter market is a result of a strategic decision by hardware vendors to lock in users to their operating systems and communications software as a means of account control.
 - Viewed from system type, hardware vendors provided 31% of mainframe applications software, 30% of mini applications software, and 18% of micro applications software in 1984.

(iii) Large Vendors

- Vendors with revenue over \$10 million accounted for 58% of the overall \$5.7 billion of applications software in 1984. These large sellers accounted for: 70% of mainframe applications, 40% of mini applications, and 64% of micro applications.
- In 1984, the top 10 applications software vendors accounted for 30% of the market (see Exhibit III-46). This contrasts to the systems software top 10 vendors which accounted for almost 50% of the market. There are several reasons for this:
 - IBM dominance in the operating system market--12% of share.
 - The additional maturity of the systems software market where the established vendors are older and larger.
- Two significant issues can be noted in regards to independent software product vendors (see Exhibit III-47).

EXHIBIT III-46

10	American Software	26	1

Total Applications Software Product Independent Market = \$4,200

Top 10 = 22% of Market

*Includes distribution revenue; see page 2

- Only one vendor--Microsoft--is a leader in both the systems as well as the applications software marketplace, highlighting the difficulty of being a major success in both of the two very different business arenas.
- In the applications leader list, only one vendor--Policy Management Systems--accrues most of its revenue from an industry-specific application (property and casualty insurance). Other vendors primarily focus on cross-industry applications. This is primarily due to the fact that the cross-industry markets began earlier than industry-specific markets, allowing vendors more time to gain market share and become established leaders.

(iv) Mainframe/Mini/Micro

(a) Mainframe/Mini

- Mainframe applications leaders (top 10) had 39% of the mainframe applications market in 1984, in contrast to mini leaders who totaled less than 30% (see Exhibits III-48 and III-49). Nine of the 10 leading mini vendors are also hardware vendors.
- The mini applications market is dominated by a large number of VARs and small private companies that provide applications solutions.
- Mini hardware vendors that provide applications software do so in a form of office automation solutions such as DEC's ALL in ONE or Data General's CEO. These are very generic office products.

(b) Micro

- The top 10 micro software leaders in 1984 accounted for over 55% of the overall micro applications software market (see Exhibit III-50). Three hardware vendors are in the list (IBM, Apple, Tandy), and two primarily

mainframe software vendors (MSA and Computer Associates). Interesting to note is that most hardware vendors' micro applications sales were from packages developed by independent or outside vendors, and mainframe vendor products were from acquisitions of established micro software companies.

b. Cross-Industry in General

- The overall applications software market cross-industry segment will have a 19% growth during the forecast period as opposed to the industry-specific segments that will have a 32% AAGR (see Exhibit III-51).
- This will be due to:
 - Maturing of the cross-industry market which consequently has more saturation.
 - Generally lower average unit price for cross-industry packages versus industry-specific packages.
 - Since management now wants to automate "the heart" of the business, industry specific packages will be the means to accomplish this.
- Segmentation of the market is as follows:
 - Mainframe/mini.
 - The cross-industry segment for mainframe/mini will have a slightly lower growth rate than the micro segment at 17% versus 20% (see Exhibit III-52).
 - The cross-industry segment will decrease from 45% of total applications expenditures in 1985 to 34% in 1990. This is accounted for by the fact that more "fine tuned" industry-

EXHIBIT III-51

TOTAL APPLICATIONS SOFTWARE PRODUCTS MARKET BY SEGMENT TYPE
1985-1990

*Average Annual Growth Rate

EXHIBIT III-52

APPLICATIONS SOFTWARE PRODUCTS MARKET BY SEGMENT TYPE, 1985-1990
(Mainframe/Mini)

*Average Annual Growth Rate

specific packages are becoming increasingly popular as users focus on automating their primary business operations which are unique to their industries.

- Micros.

- . Cross-industry applications for micros will account for a lesser growth than industry-specific applications during the forecast period (20% versus 43%). This is because users are becoming sophisticated enough to be receptive to the more complex, but higher payoff industry-specific solutions (see Exhibit III-53). In 1990, cross-industry applications will still account for over 50% of user expenditures, down from 75% in 1985.
- . In order to help vendors better understand the cross-industry market, we have outlined below the six major cross-industry segments with a brief analysis of each (see Exhibit III-54).

(i) Planning and Analysis

- The applications in the planning and analysis (P&A) segment include: budgeting, financial planning, forecasting, project management, modeling, spreadsheets, decision support systems (DSS), and integrated analysis packages (i.e., Framework, Symphony).
- Planning and analysis, a \$1.3 billion market in 1985, is the largest cross-industry application segment and will continue to remain so through the end of the forecast period (see Exhibits III-54 and III-55). The market is being stimulated by the growing installed base of micros that either introduce the user to the benefits of financial tools (spreadsheets) or create the desire within more experienced users for power beyond existing systems.

MICROCOMPUTER APPLICATIONS SOFTWARE SHIPMENTS U.S. BUSINESS

EXHIBIT III-54

CROSS-INDUSTRY APPLICATIONS SOFTWARE MARKET, 1985-1990

EXHIBIT III-55

PLANNING AND ANALYSIS APPLICATIONS SOFTWARE MARKET, 1985-1990
(Cross-Industry)

*Average Annual Growth Rate

- Positive factors impacting the P&A market are:
 - More powerful micro hardware.
 - More cost-effective mass storage; e.g., hard disks and CD-ROM.
 - Improved integration of P&A systems with transaction-processing systems.
 - Increasing acceptance of micro-mainframe links for easier access to larger data bases.
- Negative forces influencing the market are:
 - The increased time to learn new and more complex P&A products.
 - P&A systems with various modules that can take a year or longer for the entire application to be installed adequately due to complexity.
- Successful P&A products for the remainder of the decade must be closely related to functions such as DBMS, data dictionaries, graphics, statistical capabilities, and electronic mail or other communications.
- P&A systems must also closely integrate into transaction-oriented systems to give users access to more timely data for decisionmaking.
- See the section entitled "Selected Micro Applications" for a more thorough commentary on the micro spreadsheet market.

(ii) Accounting

- The accounting segment is the second largest of the cross-industry segments in 1985, and will retain its market position throughout the forecast period (see Exhibit III-56).

ACCOUNTING APPLICATIONS SOFTWARE MARKET, 1985-1990
(Cross-Industry)

*Average Annual Growth Rate

- The accounting market is one of the oldest and most penetrated traditional applications markets, and thus has a larger installed base and lower growth rate.
- The micro segment of the market will increase in percentage from 25% in 1985 to 31% in 1990. For further information on the micro accounting market, see "Selected Micro Applications" later in this report.
- Demand for financial detail to support analytical systems continues to increase. Management's need for closer business control increases the pressure to automate all components of the accounting function. In the 1985 survey conducted by INPUT of information systems managers within the 14 major industry markets, respondents in 8 of the 14 markets included the purchase of accounting software as a prime objective for 1986. This segment ranked highest of all cross-industry segments for purchase intentions.
- Accounting software will continue to increase its level of integration, both between formerly discrete accounting functions and between other cross-industry, industry-specific, and DBMS functions.
- The most successful accounting package vendors have been older, well-established vendors who introduced their products over a decade ago. These vendors will continue to remain strong. As corporations automate, there will be more of a demand to standardize accounting systems across divisions; consequently, these leaders with installed products will have the best chance to make these additional sales.

(iii) Human Resources

- The cross industry human resource segment includes such applications as:
 - Payroll.
 - Benefits.
 - Personnel.
 - Human resource management systems.
- This cross-industry segment will experience the slowest growth of all the cross-industry segments, but will still be close to a \$1 billion market in 1990 (see Exhibit III-57).
- Reasons for this slow growth are:
 - Historically, companies have tended not to support the personnel function with automation dollars, deferring instead to "line" operational departments such as production in a manufacturing firm.
 - Reduced government pressure for personnel-specific health and safety measures such as OSHA have decreased the urgency to monitor these activities effectively by automation.
 - Remote computing services (RCS) companies have been and will continue to be extremely aggressive in the payroll area. They can still provide economic solutions that handle businesses with as few as one employee.

EXHIBIT III-57

HUMAN RESOURCES APPLICATIONS SOFTWARE MARKET, 1985-1990
(Industry-Specific)

*Average Annual Growth Rate

- Forces stimulating the human resource marketplace include:
 - To remain competitive in the recruiting marketplace and to better retain employees, companies are finding that they must increasingly customize salaries and benefits packages. Consequently, this will stimulate the purchase of new software.
 - To develop or retain competitive strength, companies are finding that human resources applications such as skills inventory are a key. By tracking who is doing what, a company can maximize its people potential by having employees well matched for specific jobs. This again in turn encourages the purchase of new, more sophisticated software.
- In INPUT's 1985 annual survey of information systems managers, the purchase of software for the human resource function ranked high in importance in 5 of the 14 vertical industry segments. This type of software ranked second in importance to accounting software in the overall 14-industry survey.

(iv) Engineering and Scientific

- The continued shortage of engineers is making companies look for methods to improve engineer productivity. These companies are leveraging their engineering resources by purchasing computerized engineering devices (of which software is a key aspect) to improve productivity.
- In 1985, the engineering and scientific software market will be \$180 million, growing to over \$500 million in 1990 (see Exhibit III-58). The micro portion of the market is expected to grow from 17% in 1985 to 22% in 1990. This overall segment will have the second highest AAGR throughout the forecast period of all cross-industry segments.

EXHIBIT III-58

ENGINEERING AND SCIENTIFIC APPLICATIONS SOFTWARE MARKET, 1985-1990
(Industry-Specific)

*Average Annual Growth Rate

- One of the major factors stimulating the growth of the engineering and scientific market is the emergence of new, more cost-effective hardware designed primarily for engineering and scientific applications. The economics and ease of use of these new computers will greatly expand the population of users and will thus stimulate significant software sales. For example, RISC computers under development by Hewlett-Packard and IBM (to name but a few) will be introduced in 1986. In many cases, these higher speed systems will be able to utilize existing software, but there will be the opportunity for software developers to rewrite software especially designed to maximize the efficiency of this type of hardware.

(v) Education and Training

- The education and training segment encompasses activities that are conducted within organizations whose primary purpose is other than education. For example, education and training services performed by firms involved in manufacturing, banking, retail, and transportation are included in this segment. Education software expenditures that occur in educational institutions (i.e., schools) is included in the Education Industry-Specific market segment.
- INPUT estimates that by 1990 over 50% of all white collar workers will use some type of computer on the job. With fewer than one in five white collar workers currently using a computer, a major opportunity exists to train new users.
- The education and training cross industry segment will have the highest AAGR 1985-1990 (44%) of all cross-industry segments. This growth rate is heavily influenced by the small size of its 1985 base (see Exhibit III-59). This segment's dollar size in 1985 and 1990 will continue to rank last compared to all other cross-industry segments. In spite of this, the 1990 dollar size will not be insignificant—over \$500 million.

EXHIBIT III-59

EDUCATION AND TRAINING APPLICATIONS SOFTWARE MARKET, 1985-1990
(Cross-Industry)

*Average Annual Growth Rate

- Education and training is one of only two cross industry segments in which the micro portion of the market greatly exceeds the mainframe portion (63% in 1985--73% in 1990). This is due to low-cost quality software packages available on micros for numerous training applications. Wherever there is a PC, there is the potential for an educational workstation.
- From a penetration perspective, in 1985 about \$6 will be spent per micro CPU for education and training. In 1990, it will be about \$19 per CPU. This significant increase in penetration reflects the use of micros for training, not only for specialized computer operations, but also in many areas of personal development and growth.
- Additional stimulants to the overall education and training market include:
 - The increasing popularity of complex distributed systems that will increase the need for more comprehensive operational training.
 - Increasing popularity of PC-based interactive videodisks which produce easy to learn instructions. Major established educational video vendors are planning on switching their mode of instruction from conventional video to this computer-oriented method of training.

(vi) "Other" Cross-Industry Market

- The "other" cross-industry segment includes such applications as:
 - Word processing.
 - Business graphics.
 - Sales and marketing applications.
 - Desktop managers (i.e., Sidekick, et al).

- As shown in Exhibit III-54, the total "other" cross-industry segment is expected to retain its ranking as third among cross-industry applications from 1985 through 1990.
- This segment (along with education and training) has a very high micro percentage of market throughout the forecast period (70% in 1985 and 73% in 1990). Exhibit III-60 shows this small computer market growing from almost \$400 million in 1985 to almost \$1 billion in 1990.
- Factors influencing the growth of the entire "other" segment include:
 - The popularity of graphics among decision makers which make the numbers "come alive." This has raised managers' interest in business graphics especially in the area of presentation graphics. In addition, products as Apple's MacIntosh have stimulated a new market called "desktop publishing." This market is heavily graphics-oriented and hence stimulates the graphics software market. A further stimulus is the action of micro word processing vendors such as Multimate which are integrating graphics capabilities within their word processing packages.
 - User interest in word processing packages that cross over all types of mainframe through micro systems. See the segment entitled "Selected Micro Applications" for elaboration of the micro word processing market.

(vii) Major Micro Software Market Segments

- INPUT's market forecast for most significant types of micro software is presented in Exhibit III-61. The exhibit segments the market into major cross-industry microcomputer products and provides growth rates, for these segments for U.S. business in general as well as for Fortune 1000 accounts alone. High growth segments are highlighted in the section to follow.

**EXCLUDES ALL INDUSTRY-SPECIFIC APPLICATIONS

(viii) Selected Micro Products

- Exhibit III-62 presents the major or largest segments of micro software. Although DBMS is classified by INPUT as systems software, its usage is so closely allied with applications software that it is included here.
 - Planning and analysis is the largest revenue segment in 1985, with almost 30% of the overall micro software user expenditures.
 - Of the major segments, it has the lowest growth rate (13%) for 1985-1990. This is due primarily to a slowing in the spreadsheet market which will increasingly encounter saturation problems.
 - Most early adapters of computers were spreadsheet users.
 - In general, however, many computer users do not need nor will ever need to use spreadsheets; consequently, there is a decrease in sales potential. 1984 major vendor revenue for the spreadsheet segment is highlighted in Exhibit III-63.
 - The P&A segment is, however, doubling in dollars during 1985-1990 and will account for one-sixth of the overall micro software market by 1990.
 - The accounting market will also show steep growth. The accounting department in any company is a natural for computerization. As companies (especially small business) continue to automate, accounting will be one of the first applications.

**MICROCOMPUTER SOFTWARE:

(\$ Millions)

VENDORS	1983 REVENUE	1984 REVENUE	1983-1984 GROWTH
Lotus	\$45	\$110	144%
Microsoft	10	20	100%
VisiCorp	35	8	-77%
SORCIM/IVS	10	5	-50%
Other	-	7	-
Total Revenues	\$100	\$150	50%
User Expenditures	\$200	\$300	50%

- The micro word processing market will continue to grow.
 - As many new users purchase computers, a word processing application is a logical first or second software purchase.
 - Other stimulants to this market include:
 - Impact of connectivity--as connectivity increases in the office automation market, standalone word processing packages will be replaced by LAN versions.
 - Artificial intelligence (AI)--incorporating some types of AI in word processing packages (as Lotus is doing) will make those applications able to learn from individual users and therefore easier to use.
- The DBMS segment is expected to be the fastest growing of the large segments. One of the main uses that white collar workers have for a computer is the storing and manipulating of data. Thus, DBMS is a fundamental application that has widespread appeal, especially as these systems become easier to use. New generations of DBMS will both expand the user base as well as obsolete the old, thus stimulating a large replacement market.

c. Industry-Specific

(i) Overall

- In 1985, the industry-specific segments of the overall software product market accounted for 51% of the applications software market. In 1990, this percentage is expected to increase to 65%.

- Industry-specific projected growth reflects several factors:
 - . First, as users become more computer literate, they realize the increased payoffs of automated solutions especially at the heart of their businesses. (An example of this is the automation of order processing and inventory control for a distribution firm.)
 - . Second, as management of businesses become increasingly receptive to these solutions, they will be willing to invest the needed funds to produce the automated applications.
- Consequently, industry-specific packages will:
 - . Command higher prices since the solutions are complex and will be in demand.
 - . But will require expertise in the market for which they are being developed, as well as significant time and money investment in development as well as selling, and must be accompanied by extensive training and support.
- This last factor will decrease competition from many large software firms that sell on volume, especially in the micro segment, but will provide opportunities for VARs and smaller software developers.

(ii) Highest Growth

- The three highest industries in terms of growth by AAGR are medical, transportation, and telecommunications. These industries rank so high primarily due to the low dollar base from which they began in 1985 (see Exhibit III-64).

EXHIBIT III-64

INDUSTRY-SPECIFIC APPLICATIONS SOFTWARE MARKETS

INDUSTRY SECTOR	1985-1990 AAGR (Percent)	USER EXPENDITURES (\$ Billions)		1984-1990 GROWTH RATE RANK
		1985	1990	
Discrete Manufacturing	24%	\$.7	\$2.1	13
Processing Manufacturing	40	0.2	0.9	4
Transportation	42	0.1	0.8	2
Utilities	28	0.03	0.09	10
Telecommunications	41	0.05	0.3	3
Distribution	34	0.3	1.4	6
Banking and Finance	30	0.9	3.5	8
Insurance	26	0.3	0.9	11
Medical	43	0.3	1.8	1
Education	29	0.06	0.2	9
Services	36	0.1	0.5	5
Federal Government	18	0.02	0.06	14
State/Local Government	25	0.04	0.08	12
Other	32	0.07	0.3	7

- From a user expenditure perspective, rankings in 1985 were:
 - Banking and finance = 1.
 - Discrete manufacturing = 2.
 - Distribution = 3.
 - Insurance = 3.
 - Medical = 3.

- In 1990, the rankings do not change drastically.
 - Banking and finance = 1.
 - Discrete manufacturing = 2.
 - Medical = 3.
 - Distribution = 4.
 - Insurance = 5.

- Banking and finance has enormous changes taking place, primarily due to deregulation which has led to increased competition from existing financial institutions as well as competition from diversified institutions such as insurance companies offering financial services products. These forces lead to a demand for new products which banks must provide to remain competitive. Thus, old automated systems are becoming obsolete and will need replacement.

- The main driving force for automation in discrete manufacturing companies is the urgent need to become more competitive vis-a-vis foreign competition.
- The pressure to automate systems in the medical marketplace is primarily a result of the need to contain costs due to government pressure.
- The insurance industry will decrease in dollar ranking 1985-1990 primarily due to profitability pressures (especially in the property and casualty industries) that will slow the automation investment.

(iii) Mainframe/Mini

- In 1985, the banking/finance and discrete manufacturing segments will account for 55% of overall mainframe/mini user expenditures for industry-specific software (see Exhibit III-65). In 1990, the percentage of these two segments will total 48%. This will be primarily due to the lower than segment average AAGR (29%) by the discrete manufacturing segment (20%) in spite of large dollar increase over the forecast period. Both segments will still retain their 1985 ranking in 1990.
- Increasingly, cross-industry applications will be incorporated in industry-specific applications. This plus the integration of specific vertical modules will increase the average price for a mainframe/mini products.
- From a penetration perspective, in 1985 about \$1,750 will be spent per mainframe/mini system for industry-specific software. In 1990, this amount is expected to double per CPU to about \$3,000.

(iv) Hot Verticals-Micro

- The industry-specific segment of the micro applications software market will total about \$500 million in 1985--or 25% of the overall micro applications market (see Exhibit III-66). With a 43% AAGR from 1985-1990, industry-

Other Industry Specific	3	67	5	40	52
Total	\$352	34%	\$473	\$3,034	45%

specific applications will account for almost 50% of applications software user expenditures in 1990. In 1990, the micro industry-specific market will be greater dollarwise than the whole micro software market in 1985.

- Exhibit III-67 and III-68 show eight "hot" micro vertical segments, so labeled due to steep growth curves. These growth rates must however be put into perspective in that in 1985 the medical market is still only one-eighth the size of the micro word processing market--in 1990 only one-half the size.

B. MARKET STRUCTURE

I. FORTUNE 1000 VERSUS SMALL BUSINESSES

- The Fortune 1000 market will have a slow but steady adoption of micros. The installed base in these companies in 1985 will be 1.1 million units, growing to 3.4 million units in 1990. Major companies have stated their commitment to end-user computer literacy, and with over 25 million workers in Fortune 1000 companies (50% of them being white collar workers), the potential for microcomputer hardware and software sales is great.
- The market for micro cross-industry application software sales to the Fortune 1000 is expected to increase at an AAGR of 21% throughout the forecast period (see Exhibit III-69).
 - Leading 1984 products that were sold to the Fortune 1000 are included in Exhibit III-70.
 - Ranked by 1985 sales, the leading products sold to Fortune 1000 customers include:
 - Spreadsheets - \$70 million.
 - Word processors - \$50 million.

Source: Compilation of INPUT estimates, vendor estimates, Corporate Software Bestseller lists, Softsel Hotlist, and Business Computer Systems Business Bestseller List.

- Integrated software - \$42 million.
 - DBMS - \$41 million.
- Products with the highest forecast AAGR to the Fortune 1000 include:
 - AI (primarily expert systems and expert system generators) - 72% growth.
 - Communications software - 42% growth.
 - Graphics - 34% growth.
 - DBMS - 30% growth.
- The Fortune 1000 market, through organizations as the Micro Managers Association (MMA) and Technology Assessment through Strategic Cooperation (TASC), has developed the power to significantly influence the overall micro software distribution structure as well as influence software product design (see Chapter IV for additional information on micro software distribution).
 - Due to corporations' desires for volume discounts as well as monitoring training and support costs, increased product standardization will occur in the Fortune 1000 market. Companies will purchase future software products on a select basis from a few well-known, well-positioned vendors with a product line as integrated and compatible as possible,
 - Hard disks are in widespread use in large corporations. Consequently, copy protection schemes that hinder the use of software products on hard disks are being removed largely as a result of pressure from these volume users.

2. VENDOR REVENUE GROWTH

a. Mainframe/Mini

- In the ^{mini}micro/mainframe area, most major software vendors will have increases in revenue 1984-1985:
 - Computer Associates = 40%
 - American Software = 35%
 - Cullinet = 20-25%
 - Pansophic = 20%
 - Software AG = 20%
- The growth, however, in most cases will be less than anticipated, reflecting the 1985 industry slowdown in general.

b. Micro

- Most major micro software vendors will experience substantial revenue growth in 1984-1985.
 - Lotus = 22-35%.
 - Microsoft = 12-20%.
 - Ashton-Tate = 25-50%.
 - Software Publishing = 20%.

- Multimate = 40%.
 - Borland = 30%.
 - Microcomputer Division of Computer Associates = 35%.
- Two major vendors with significant decreases in revenue in 1985 are MicroPro (-25%) and Digital Research (-25% to -35%). These vendors are not indications of the industry as a whole. The companies' problems had to do with aging products, scarce resources spread too thin, and the slowness of management in responding to market changes.

IV ISSUES AND TRENDS (MACRO FACTORS)

IV ISSUES AND TRENDS (MACRO FACTORS)

A. INFORMATION SYSTEMS ATTITUDES AND EXPECTATIONS

- The following data is extracted from INPUT's 1985 Information Systems Program (ISP) Annual Survey. The data is a compilation of responses from over 150 interviews of IS executives in companies ranging from \$200 million to the largest corporations in the country.
- This information reflects the concerns, objectives, and plans of some of the most influential buyers in the nation. Careful study of their responses will help vendors to more carefully attune their market strategy to reflect the changing realities of the marketplace.

I. MAJOR I.S. ISSUES

- Information systems (IS) issues focus on cost and applying technology to solve business problems (see Exhibit IV-1).
 - Although there is considerable publicity about IS being the basis for new products and services, cost is the top strategic issue being addressed by IS. In fact, cost is either the top or second priority issue for all planning periods. This is due to management's perception that IS' major role is to improve productivity and reduce the cost of product and services. The age of IS contributing to revenue has yet to dawn in most industries.

MAJOR I.S. ISSUES

Strategic	Tactical	Operational
Cost Containment	Cost Containment	Improve Prod.
Govt. Deregulation	Info. Delivery	Contain Costs
Non-Traditional Competitors	Integrate IS & Corp. Planning	Improve Info. Delivery

- IS is a technical resource. The challenge to the corporate business strategy is to apply this resource so that the organization will operate more effectively as well as more efficiently. In the next three years, two areas will be the center of this activity:
 - . Information distribution both internally and to customers will provide the potential for product differentiation and exploitation of market information.
 - . The information structures in many industries are being redesigned to be customer oriented instead of product, application, and function oriented.
- The changing regulatory environment is having a profound effect on the competitive nature of many industries. Barriers of entry are being lowered, and a means for quick and profitable entry into these markets is flexible and responsive information systems. The success and survival of many companies will depend on the effectiveness of IS.

2. I.S.' CHANGING ROLE

- In the past, management has viewed IS solely as an operational resource. IS had little input into the corporate planning process, and systems were developed primarily to increase control and improve efficiency of back office activities. IS reported to the finance organization which perpetuated IS' role as an extension of the accounting department.
- IS' role has changed. Management is realizing the advantage of using systems to aid decision making. The end-user revolution has spawned a new, large group of powerful users: middle management. The increased visibility of IS has moved it from a purely operational department to a support and service organization. IS usually reports to an administrative executive and is begin-

ning to contribute to the corporate planning and product development process (see Exhibit IV-2).

- In the next five years, IS will have a more strategic role. It will report to a senior executive and will become an integral part of the corporate planning process. IS will become more consultive, advising senior management on corporate direction based on information systems technologies. IS will become a service organization. This will require business as well as technical skills. IS will have a vital role in applying technology to corporate strategies to ensure the success of the organization in the 1990s and beyond.

3. IMPACT OF TECHNOLOGY

- The impact of technology is summarized in Exhibits IV-3 and IV-4.
- End-user computing is having a major impact in many firms. The explosive growth of microcomputers, the growing support and training needs, and the use of decision support systems have put resource demands on IS. In the near term, IS is establishing service-oriented, end-user support organizations. In the longer term, IS will define end-user needs and incorporate them in IS and corporate strategic plans.
- Part of the long-range end-user plans may include the use of departmental processors and distributed systems development. Many respondents believe that departmental processing will be the ultimate catalyst for moving end users from spreadsheets to integrated systems. In the near term, IS is looking toward micro-to-mainframe applications as a way of satisfying departmental processing demands. The micro portion of these systems, distributed systems development (DSD), may be remotely developed by end users and business analysts in the near future.
- Merging voice and data communications holds great potential for containing the mushrooming communications cost. However, most respondents are

I.S.' ROLE IS CHANGING

View: Operational → Strategic

Reporting: Finance → COO

Planning: None → Peer Contributor

Function: Technician → Consultant

IMPACT OF TECHNOLOGY

	IMMEDIATE	NEAR TERM	LONG-TERM
End-User Computing	High	Medium	Medium
Departmental Processing	Low	Low	High
Distributed Systems Development	Low	Medium	Medium

IMPACT OF TECHNOLOGY

	IMMEDIATE	NEAR TERM	LONG-TERM
Voice/Data Integration	Low	Low	Medium/ High
LAN	Low	Low	Low

skeptical about whether the technology will exist to make merging voice and data a reality. The respondents believe, however, that the support of both voice and data should be merged. Fifty-nine percent of the respondents have merged these organizations, usually as a part of the IS department.

4. I.S. BUDGET GROWTH WILL REMAIN THE SAME

- IS budget growth will remain at about 10% in 1986. The major growth areas will be processors, storage devices, and data communications. The smaller growth areas will be outside processing and professional services (see Exhibit IV-5).
 - The demand to improve information delivery is fueling the demand for more processing power, better networks, and more accessible, better organized data bases.
 - The dampened demand for outside processing is reflective of management's desire to process information internally. Professional services are being used for specific problem resolution as opposed to general-purpose consulting. Professional services are viewed as a discretionary, deferrable expenditure by many organizations.
- Eighty-four percent of the respondents are planning to increase their IS budgets in 1986, but 50% plan to increase their budgets at a lower rate than in 1985. Hardware, personnel expenses, and software acquisitions are the primary contributors to increasing IS budgets. Factors that are decreasing budgets include staff reductions, improved hardware efficiency, and improved productivity.
- IS budgets have the same dependence on corporate revenues and profit as other departments in the enterprise. The services sector's IS budget has the greatest dependence and the process manufacturing and transportation sectors' budgets have the least dependence on corporate revenues.

I.S. BUDGET GROWTH WILL REMAIN THE SAME

Budget Growth

Factors Increasing Budget	Factors Decreasing Budget
Hardware	Staff Reduction
Personnel	Improved HW Efficiency
Software	Improved Productivity

5. I.S. BUDGET DISTRIBUTION

- The distribution of the 1985 IS expenditures remained essentially the same as in 1984. Personnel and hardware expenses account for over three quarters of the IS budget. Data communications is planned to grow at 11% in 1986, and many respondents are focusing on controlling costs of this category. Sixty-six percent of major software development is planned to be done entirely by internal personnel. This has kept external software expenditures at 7% of budget, with a relatively low growth rate of 5% in 1986 (see Exhibit IV-6).
- Seventy-seven percent of corporate information systems spending is controlled by IS.
 - Seventy-one percent of corporate and 92% of IS budgets are spent on centralized computing. In 1986, this is projected to become 68% corporate wide and 90% for IS.
 - Twenty percent of corporate computing expenditures will be for distributed processing. This will grow slightly to 21% in 1986. Distributed processing will decrease slightly in the IS budget, from 5% in 1985 to 4% in 1986.
 - End-user computing will grow. Corporate wide, it will grow from 9% in 1985 to 11% in 1986. For IS, it will double, growing from 3% of the IS budget in 1985 to 6% in 1986. Most of this growth will come from central IS resources.

6. I.S. IMPACT ON COMPETITIVE POSITION

- IS budgets are only moderately dependent on revenues. Although management is concerned with costs, they are also aware that information systems may enhance the firm's competitive advantage (see Exhibit IV-7).

I.S. BUDGET DISTRIBUTION

1985

Percent of IS Budget

I.S. IMPACT ON COMPETITIVE POSITION

- All - All Industries
- B - Banking & Finance
- D-M - Discrete Manufacturing
- P-M - Process Manufacturing
- I - Insurance

- D - Distribution
- U - Utilities
- T - Transportation
- S - Services
- M - Medical & Health Care

- The respondents were asked to rate the dependence of their IS budget on revenues, and only the services sector rated their budget as being highly dependent upon corporate revenues. No sector's IS budget had a high dependence on corporate profit.

- The respondents were also asked to rate management's perception of the relationship between investing in IS and the company's competitive position.
 - Distribution and insurance respondents indicated there is a high relationship between the investment in IS and the company's competitive position. No sector's respondents indicated there was a low relationship.

 - Only the medical and services industries rated the expected effect of IS on competitive position as lower than the dependence of IS budgets on corporate revenues. This indicates that most respondents' management believe that IS has the potential for enhancing the company's competitive position and that the investment on IS should be more dependent on strategic need than current revenues. However, many companies still are limiting IS investments due to corporate cost constraints. When, or if, these constraints are lifted, IS should see its budgets increase at a faster rate.

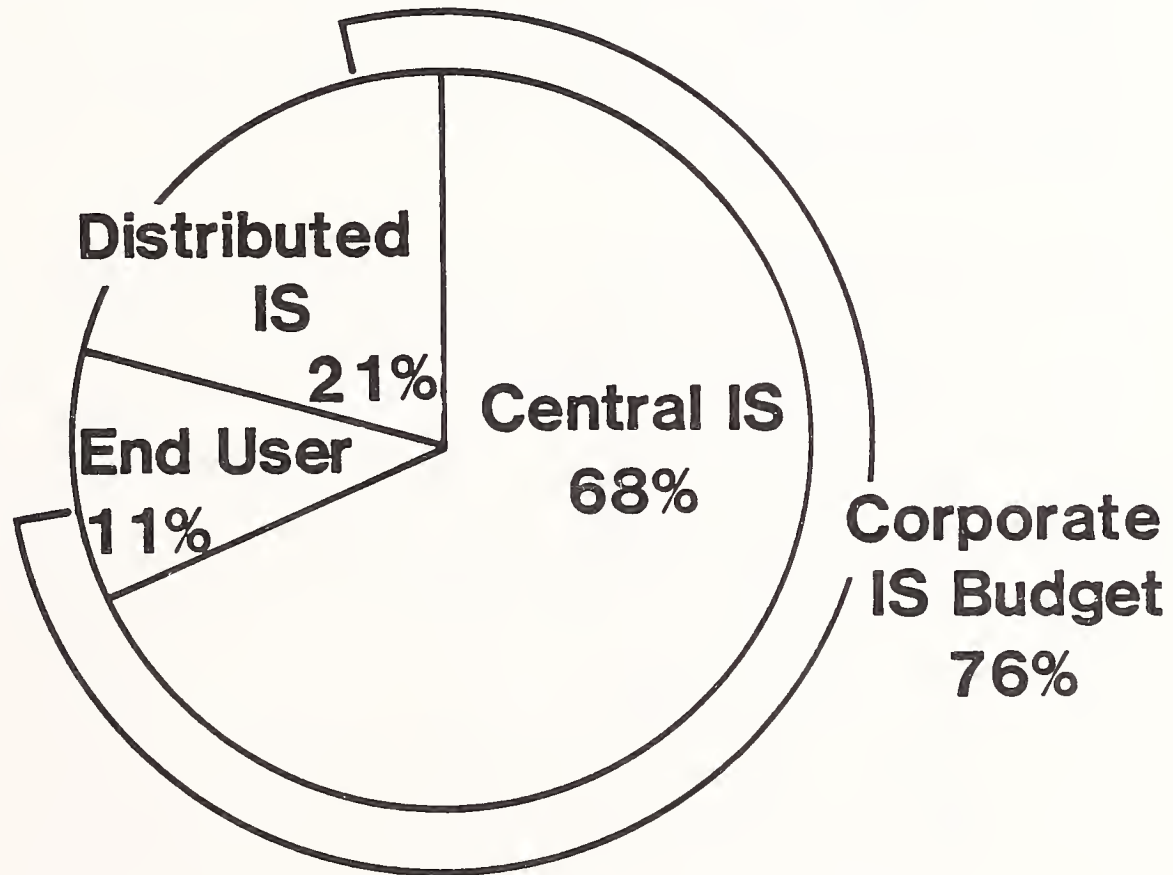

- IS budgets will grow at about the same rate in 1986 as in 1985. Approximately three quarters of the corporate IS expenditures will be controlled by the corporate IS organization. Exhibit IV-8 and IV-9 show the distribution of the corporation's IS spending in 1985 and projected for 1986.
 - Central IS expenditures will reduce slightly in favor of end-user computing.

DISTRIBUTION OF I.S. EXPENSES

1985

**PROJECTED DISTRIBUTION OF I.S. EXPENSES
1986**

- The corporate IS department will control about the same portion of IS expenditures. In 1985, 5% of corporate IS budget will be allocated to distributed computing and 3% to end-user computing. In 1986, it is projected that 4% of the corporate IS budget will be allocated to distributed computing and 6% to end-user computing.

7. BUDGET ANALYSIS

- IS budget growth rates will continue to grow at 10%. The distribution among budget categories has not changed markedly over the past five years. Exhibit IV-10 shows the 1985 budget distribution and projects the growth of budget categories for 1986.
 - The largest projected growth areas are processors, storage devices (i.e., DASD), and telecommunications. The need to improve information delivery internally and to customers is fueling the demand for these budget categories. The restructuring of data bases to become more customer oriented and integrated among function, products, and applications is increasing the demand for more mainframe storage.
 - The smallest growth areas are outside processing and professional services. There is a continuing trend to reduce outside processing whenever possible. The only growth area is the use of public data bases by end users. Professional services is primarily viewed as a discretionary item. The use of professional services is being limited to assistance on specific problem areas.
- Eighty-four percent of the respondent IS organizations are planning to increase their budget in 1986, but half of these institutions are planning for lower growth rates than 1985.
 - Factors contributing to increasing the IS budget include (in order of most frequently mentioned factors):

EXHIBIT IV-10

1985 BUDGET DISTRIBUTION AND 1985/1986 CHANGES

BUDGET CATEGORY	1985 PERCENT OF I.S. BUDGET	1985-1986 EXPECTED BUDGET GROWTH
Personnel Salaries and Fringes	41.6%	7.4%
Mainframe Processors	10.9	10.0
Minicomputers	2.7	11.5
Microcomputers	2.1	10.0
Mass Storage Devices	5.8	10.5
Other Hardware	7.2	6.9
Total Hardware	28.7%	9.5%
Data Communications	9.3%	11.0%
External Software	4.5	5.0
Professional Services	2.6	0.9
Turnkey Systems	0.8	2.6
Software Maintenance	1.2	5.0
Hardware Maintenance	5.8	5.1
Outside Processing Services	1.4	0.0
Other	4.1	3.0
Total	100.0%	10.2%

- Hardware.
 - Personnel expense.
 - Software.
 - Inflation.
 - Office systems.
 - Data communications.
- Factors contributing to decreasing the IS budget include (in order of most frequently mentioned factors):
 - Staff reductions.
 - Improved hardware efficiency.
 - Improved productivity.
 - Improved software.
- IS budgets are moderately dependent on corporate revenue and profit. Only the service industry has a high dependence between IS budgets and corporate revenue. This is because many of the service companies market IS as a product. The highest dependence on profit is in the medical and health care industry. This industry looks for discretionary funds to invest in IS.

B. IMPACT OF TECHNOLOGY

1. OVERALL

- Constant improvements in technology are a major driving force in the software market. They lead to:
 - More powerful hardware at decreased cost (which will increase the availability of computers, especially micros).
 - More sophisticated hardware which will lead to better, easier to use software.
 - A wave of new products, new markets, and new types of software solutions.

2. PROCESSORS

- In the high end micro area, more powerful processors such as the Intel 80386 and the Motorola 68020 will provide greater speed and better memory management.
 - Hardware designed around these chips will impinge directly on sales of traditional minicomputers.
 - This greater processing power will in turn stimulate the development of new software.

3. OPTICAL MEMORIES

- Optical memories have the cost, capacity, and performance characteristics that are necessary to effect substantial changes in data base management.

- It is not necessary to wait for erasable drives to make imaginative use of the technology.
- As it now exists, optical disks can be extremely valuable for archival storage (magnetic tape and micrographics replacement), electronic filing (image processing), and supplementing magnetic disk storage.
- New data base software will be needed to maximize the use of these products.

4. DATA BASE MACHINES

- Data base machines are beginning to appear as alternatives to general purpose processors with conventional DBMS software. While the impact on the DBMS market has not been great up to this point, the recognition of the central host as being fundamentally a data base machine will increase the competitive pressure on conventional DBMS products. (There are already reports of data base machines handling an IBM 3084 workload at one-tenth the cost.) These hardware-oriented systems will require new types of DBMS software to best optimize their performance.

5. ARTIFICIAL INTELLIGENCE (AI)

- Artificial intelligence refers to the study of the processes in which humans perceive and assimilate data (and use reasoning to process this data) for the purpose of duplicating these processes within computer systems. AI also refers to the computer systems that accomplish these processes.
- The major AI categories that affect software development and sales are:
 - Natural language systems.
 - Expert systems.

- Speech understanding systems.
- Symbolic and logic programming languages.
- Definitons are as follows:
 - Natural language systems (e.g., INTELLECT, EASYTALK) receive as input typed natural language statements and translate these statements into a command syntax that the computer can understand.
 - Expert systems applications (e.g., MYCIN, DENDRAL) contain specialized factual and heuristic knowledge. When inquiries are made by end users, this knowledge is used to make logical deductions for responding.
 - Symbolic programming languages (e.g., LISP) manipulate symbols and handle strings of information. In addition to being useful for solving algebra problems, these products are useful for parsing natural languages in AI.
 - Logic programming languages (e.g., PROLOG) are designed for programming that uses a large amount of logical operations in programming data. These languages are useful handling rule-based applications like expert systems.
- The first three types of AI are directly involved with supporting the end user either with ease of use or ease of access.
- The last category of products are used primarily by programmers in developing more sophisticated software.
- INPUT estimates that the AI software market will grow from \$20 million in 1985 to almost \$200 million in 1990 for an AAGR of 58%.

- Factors positively impacting the AI market growth include:
 - Japanese "Fifth Generation" project perceived as a threat to the U.S. high tech industry.
 - Decreasing hardware price/performance ratio of supermicros that makes it more economically feasible to develop AI applications.
 - High Department of Defense interest in funding AI projects.
 - AI gaining recognition in certain vertical markets as a competitive weapon for managing information. In particular, banking, insurance, and manufacturing segments are funding the development of expert systems for this reason.

- Negative AI growth factors include:
 - User confusion as to "what is AI and how can it be used?"
 - Despite the fact that expert system generators are now available, the cost of purchasing let alone maintaining these systems is high. Packages that may be used by only a select few within an organization can run as high as \$80,000 for software alone, with another \$30,000 for a single user workstation.

C. MARKET STRATEGY

I. PRICING

- The price at which a software product sells is the net result of the complex interaction of hundreds of factors. They range from logical vendor control-

lable considerations such as product features, to support, to emotionally based buyer perceptions of companies, products, or people.

- The seller's continual economic survival depends upon accurate pricing. Selection of the right product price that will optimally balance buyer interest with vendor income requirements is one of the most challenging management functions.
 - a. Profile of Revenue Sources, 1990 Mainframe/Mini
- In 1984, an average software product vendor received revenue from a variety of sources.
 - Twenty percent maintenance.
 - Thirty percent lease.
 - Fifty percent procurements.
- Due to increase in the installed base of software products, the maintenance portion of revenue as well as revenue from leasing are expected to increase. In 1990, INPUT expects a typical vendor's revenue source to be divided thusly:
 - Twenty-five percent maintenance revenue.
 - Forty percent lease (month to month).
 - Thirty-five percent new procurements.
- The types of payment plans for the licensing of software products that companies offer in many ways directly impact a company's annual revenue, and thus its business options.

- The three major types of payment plans are:
 - Lump sum (the entire license fee is paid within five months or less of the signing of the contract). The user typically has the right to use the product for up to 99 years thereafter.
 - Installment plan (the license fee is paid over a period of from six months to several years, usually not more than three years). After the payment of the final installment, the user has the right to continue to use the product without further payment, except for optional software support.
 - Lease or rental plan (the user pays a periodic license fee, usually monthly). Whenever the payments cease, the software must be returned to the vendor unless the buyer converts to a lump sum or installment plan.

- Considering this data, INPUT expects that in 1990, of the \$30 billion in mainframe/mini software product that is expected to be shipped (e.g., new procurements), 20% of it will be by lump sum payment and 80% will be on some type of month-to-month payment plan.

- The cause of this change in purchase behavior will be primarily due to an increasing number of sales that will be made to end-user departments within companies rather than a central IS department. These departments will have in general restricted budgets and will be less able to pay via lump sum.

- Implications to vendors are:
 - Vendors will need more money to penetrate a market, and vendors will also need to find sources to finance customers.

- With month-to-month payment plans, short-term revenue is deferred, but after a few years monthly revenues will produce a stable revenue stream. This tends to favor large established vendors that can afford to "wait out" the initial time needed to make month-to-month payments profitable.
- According to a recent INPUT survey, in 1984 almost 60% of all respondents received payment by lump sum, 8% by installments, and 33% by lease rentals.
 - b. Mainframe/Mini Pricing
- Pricing as a central element in a well-conceived mainframe/mini software product marketing strategy has not yet reached its full potential.
 - Recent discounting, although only temporary, reflects management's reaction to present market pressures.
 - Software product vendors for the most part have been lacking in creative pricing innovations.
- Although software product prices experienced a lower than expected growth rate over the past two years, INPUT expects that price levels for software products in general will increase over the next two years (see Exhibit IV-11).
 - Discrete manufacturing is expected to have the highest pricing level change (about 10%). This will be due primarily to:
 - Increased user demand.
 - Management focusing again on company long-term strategy that will lessen price discounting.

PRICES VOLATILE, BUT TREND IS UP

- The accounting market will experience between a 3-5% pricing increase due to the large replacement market for systems that are 10 to 20 years old.
- The systems software product pricing increase is similar to the accounting market. End-user computing is one of the driving forces in this market whereby the solutions will be more important than price in the purchase decision.
- Vendors are urged to give pricing a more central role in the overall marketing strategy. Pricing should be given the image of a teamwork decision process instead of a corporate fiat. This can be accomplished by:
 - Educating key personnel concerning the payoffs from improved pricing approaches.
 - Keeping them aware of market changes that can be affected by a pricing change.
 - Encouraging the contribution of new ideas.

c. Micro Pricing

- Pricing for similar micro products spans the range of under \$100 to over \$500. Pricing consequently is a major source of confusion for new as well as sophisticated software purchasers.
- In the Fortune 1000 market where pricing is not as major an issue as for a smaller business, the purchase of well-known, higher-priced products with additional features and capabilities will still continue. Corporations, however, will attempt to receive the best price on these products by site licensing or through mail order purchasing.

- Networked and multiuser products will tend to keep the average price of micro software stable in spite of the popularity of quality products as those from Borland International that sell in general for under \$100.
- As with the sale of all types of software products, more important than price to the end user are product performance, ease of use, and vendor financial stability and name recognition.

2. CUSTOMER SERVICE AND SUPPORT

a. Service as an Opportunity

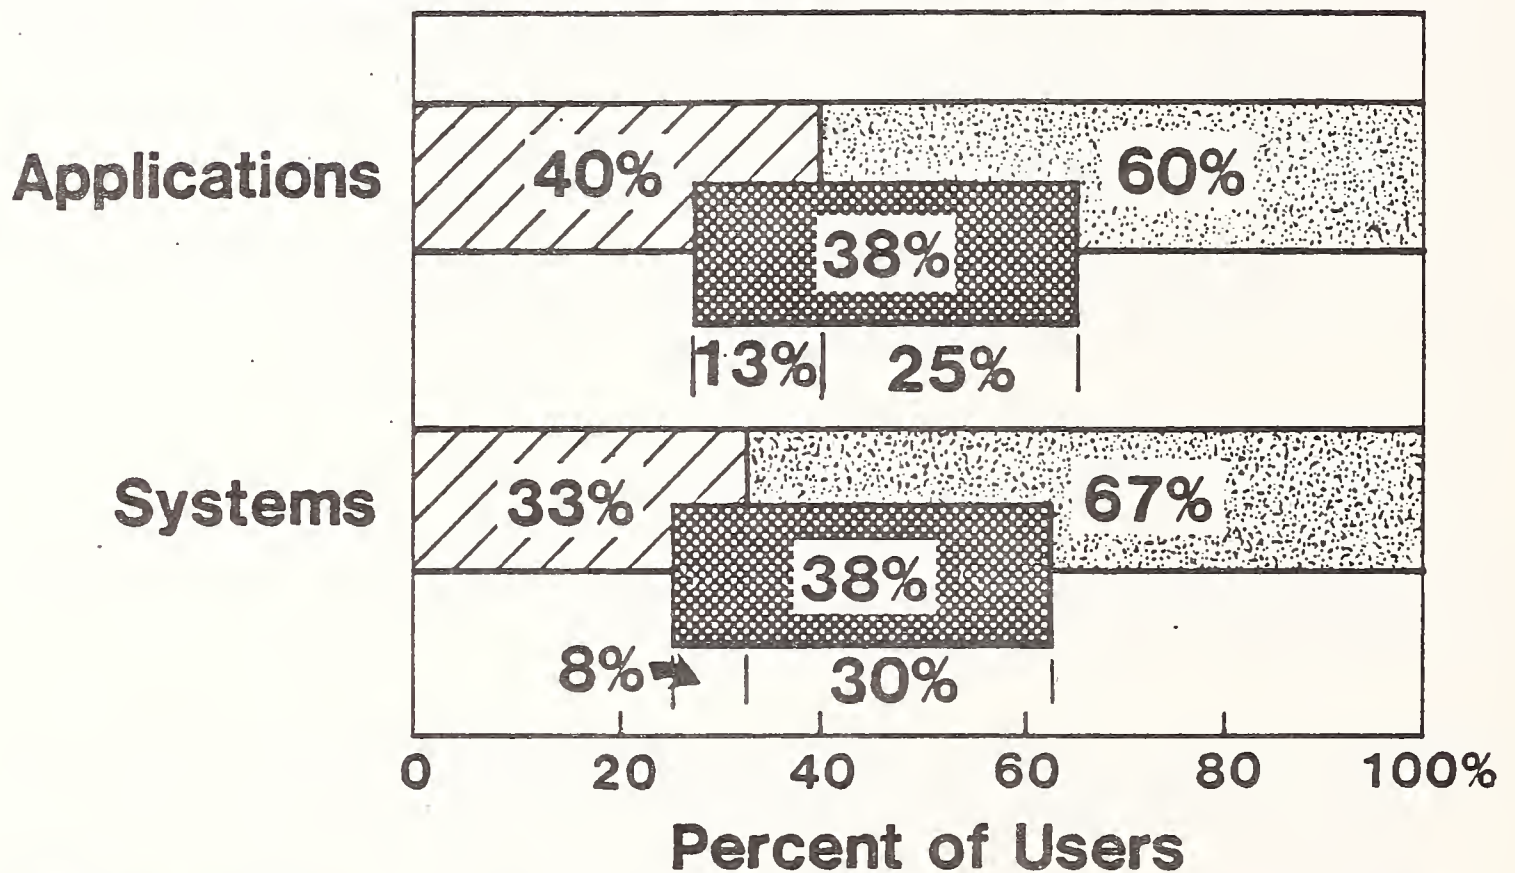

- Support includes:
 - Hotline inquiry.
 - Enhancements.
 - Fixes.
 - Right to upgrade at a decreased price.
 - (i) Mainframe/Mini
- Large system software service and maintenance opportunities are growing very rapidly due to demand by users for improved services. Currently, over 80% of large system software users are performing some type of software support internally since external support from the vendor for certain types of software is not available or does not meet user requirements.

- User attitudes are elaborated below:
 - In a recent INPUT survey on pricing, most responding users were satisfied with the pricing of a vendor's support services (see Exhibit IV-12). Sixty percent of the systems software users and 67% of the applications software users felt that prices were acceptable.
 - Interestingly, 38% of the respondents also indicated that they would be willing to increase their software support expenditures if the support services were expanded to truly support users' current and future needs.
 - Consequently, vendors have the opportunity to increase revenue as well as customer satisfaction by increasing support services.

(ii) Micro

- Software support will become an increasingly important revenue stream for both microcomputer software vendors and VARs.
- From a recent INPUT survey, it was determined that in 1985 support for micro products averages 27% the retail price of a vendor's software package. In other words, if a product sells for \$200, a vendor would charge an average \$54 per year for support (see Exhibit IV-13).
- Users are very interested in support. Thus, it is a significant opportunity for vendors during the next five years.
 - In 1985, of vendors interviewed that provided support, 17% of their total revenue was due to support. In other words, a company earning \$10 million in revenue would have \$1.7 million of that revenue from support charges.

USER ATTITUDES TO PRICING

-  Prices are too high.
-  Prices are just right.
-  Would pay more for better support.

SOFTWARE PRODUCT SUPPORT

- Support Averages 27% of Retail Price
- Revenue Stream Increasingly Significant

Percent of Vendor Revenue

- But 37% of Users Dissatisfied with Support

- As the installed base of packages increases, support revenue, too, will increase.
- In 1990, 22% of vendor revenue is expected to be support related.
- But--the caveat and the challenge--vendors will not reach this 22% 1990 support revenue potential if users are dissatisfied. In 1985, 37% of a sample of users expressed dissatisfaction with support, especially hotlines and fixes. Thus, opportunity exists, but only if vendors respond with truly value-added support.

b. Consulting

- Support can come in forms of:

- Conversion (old data to new).
- Training (how to use the system).
- Maintenance.
- More importantly, consulting with the customer as to how to make the system a success in that particular customer's environment. For example, when installing a general ledger package, consulting with the customer as to how it fits with an existing financial modeling package (or with other software systems the customer may already have installed) can be a highly prized service.

3. DISTRIBUTION

a. Mainframe/Mini

- Mainframe software products have primarily been sold through direct sales; mini products through hardware vendors and VARs.
- Software product vendors will increasingly seek alternative distribution channels as a way of controlling their heavy marketing and sales expenses.
- New distribution channel opportunities will exist in the future, such as:
 - Using customers to (re)sell systems (as a bank selling a software vendor's cash management package to large corporate clients).
 - Selling the software product to either hardware or software product vendors to be imbedded in their products--examples are Oracle selling its data base package to hardware vendors and ADR selling their DATACOM/DB to applications software vendors for a more integrated product line.
 - Software product vendors participating as subcontractors to system integration vendors such as EDS.
 - And finally, and many ways one of the most intriguing distribution opportunities for software vendors in the future, licensing a product to IBM. Examples of this include UCCEL's licensing of UCC TWO (DUO) to IBM after marketing it by themselves for over a decade, or IBM's marketing of CADAM or INTELLECT.

b. Micro

- INPUT forecasts that there will be a major shift in market share for several channels during 1985-1990 (see Exhibit IV-14).
 - Dealers were the first major software distributors, but other channels have emerged or grown competing for revenue money.
 - With increased competition, dealer market share is expected to half in 1990 from 53% to 22%.
 - End-user software expenditures through this channel will double, however.
 - User expenditure through VARs will increase 10 times, making their market share close to dealers in 1990. This will be due primarily to the large increase in industry-specific software sales.
 - The other growth area is direct sales. This segment is expected to increase dramatically, especially with the acceptance of site licensing and volume discounts.
 - Although many vendors have recently adopted a site licensing policy, few have been actually sold.
 - Presently, site licensing confuses the marketplace and slows the sales effort due to inconsistent pricing policies.
 - Lesser well-known micro vendors have been most active in promoting site licensing. These companies have limited advertising budgets and inadequate distribution networks; consequently, they have the most to gain from these arrangements.

INPUT®

**MICROCOMPUTER SOFTWARE SALES
TO U.S. BUSINESSES**

Distribution Channel	1984		1990	
	%	\$M	%	\$M
Computer Retail	53%	\$1,170	22%	\$2,400
Mail Order	20	440	40	4,300
VAR	10	220	20	2,200
Software Only	5	110	3	300
Direct	2	44	10	1,100
Other	10	220	5	500
Total	100%	\$2.2B	100%	\$10.8B

- . In contrast, major micro software companies fear site licensing would disrupt their existing distribution channels and pricing structures. These vendors in the near future will most likely offer site licensing in the form of volume discounts serviced in many cases by major local software dealers.

V COMPETITIVE DEVELOPMENTS

V COMPETITIVE DEVELOPMENTS

A. ACQUISITION TRENDS

I. OVERVIEW

- Over the past decade the rate of acquisitions in all types of industries has decreased yearly. During the same period, the rate of mergers and acquisitions in the information services industry has steadily risen.
- Principal among the companies targeted for acquisitions in the past four years have been software companies. In 1984, 57% of all information services company transactions have been these companies (see Exhibit V-1). Note: the number of transactions is used as a yardstick to avoid the enormous impact of the GM/EDS purchase on the percentages by value.
- Software product acquisitions are likely to remain strong. This is due to the wide variety of opportunities in the overall software product market as well as the possibility for profit margins higher than in most industries.
- Acquisitions do not, however, necessarily contribute to the growth of the overall information services industry revenue and profits. It can be argued that they detract from it in the short term, in many cases due to the management energy required to coordinate the product lines and restructure the organization at all levels after the acquisition. In the long term, the

SOFTWARE COMPANIES TAKE CENTER STAGE WITH ACQUISITIONS

DELIVERY MODE	PERCENT					
	1982		1983		1984	
	#	\$	#	\$	#	\$
Processing Services	47%	53%	30%	44%	36%	80%
Professional Services	7	6	10	2	7	1
Software Products	46	41	60	54	57	19

Source: Broadview Associates

acquisition can be expected to have a positive effect on the industry by concentrating resources in the hands of a quality, forward-looking management team.

- Examples of several significant 1985 software product company acquisitions follow:

2. ADR

- In late 1985, Ameritech, one of the seven regional telecommunications holding companies spun off from AT&T, initiated a tender offer to acquire well-known mainframe systems software vendor, Applied Data Research (ADR), at a cost of over \$200 million in cash. The transaction is the largest to occur in the software industry.
- The main advantage to ADR of this acquisition is the added revenue stream for increasing R&D efforts that Ameritech can provide. As the DBMS market continues to increase in competitiveness (primarily due to IBM), product improvements and enhancements are becoming increasingly important.
- Benefits to Ameritech include:
 - A competitive edge in the software marketplace for ADR product as well as internally developed Ameritech product distribution.
 - The ability to leverage off of ADR's system software expertise to develop new products for in-house use as well as products for commercial sales.

3. MULTIMATE

- In July of 1985, Ashton-Tate stated its intention to acquire Multimate, a major micro word processing product vendor, for \$19 million. This acquisition was the largest in the micro software industry.

- By this acquisition, Ashton-Tate now has strong product offerings in two of the three micro software categories: DBMS and word processing. The third major category, financial modeling, is dominated by Lotus.

4. BORLAND AND ANALYTICA

- In October 1985, Borland International, the innovative-pricing micro software vendor, acquired Analytica, a two-year vendor of Reflex, a micro DBMS product.
- Prior to the acquisition, sales of the product had been slow. Immediately after the acquisition, Reflex's price was dropped from \$495 to \$99 and reportedly sales have increased dramatically.
- In the near future, Borland plans to introduce add-on software products for Reflex--most likely templates that would be targeted toward specific markets or industries.

5. LOTUS

- In 1984, Lotus Development Corporation, the leading micro software vendor, acquired Software Arts, the developer of VisiCalc. This was one of the first of several joint ventures or acquisitions that the company has made since then.
- One of the most recent, in December 1985, was the acquisition of a small company called GNP Software which makes a product named HAL that interfaces with Lotus 1-2-3. HAL is a low cost natural language interface that greatly simplifies the common command structure for 1-2-3. This acquisition saves Lotus time and money in developing a similar product and can add value to Lotus present and future product offerings.

6. STERLING AND INFORMATICS

- In June 1985, after two rejected buyout bids, Informatics General, a leading mainframe software vendor, agreed to be acquired by Sterling Software, a holding company for software product firms.
- The company was acquired for \$126 million or \$27 a share.
- The acquisition does not help Sterling dominate any one market since the companies' product lines do not overlap, but it does help Sterling expand the number of nitch markets in which it is involved. The new segments that Informatics products will add to Sterling are law and accounting--the company already services the banking industry.
- Sterling also acquires an increased market presence with an established sales force and offices that will aid in expanding their distribution network for Informatics as well as Sterling product lines.
- With the addition of such a large company to their base, Sterling has the advantage of economies of scale whereby the company can decrease the marketing and sales expense per unit sold.
- Another opportunity for Sterling is the possibility of increasing revenue of Informatics simply by implementing a different, more aggressive approach to management.

B. STRATEGIC PARTNERING

I. OVERVIEW

- As the pace of technology increases, software vendors are both positively and, more often than not, negatively affected. Shorter product life cycles translate into higher front-end costs for developing markets and shorter payback periods in which to recover investments.
 - This fact about the industry, as well as the realization by both large and small companies that they cannot specialize in every facet of the businesses they have chosen, has led to a new cooperative concept among companies called strategic partnering.
 - In this agreement, separate legal entities are assigned a role within the overall strategic plan of a given vendor.
 - The purpose of this partnering is to give the vendor additional capabilities and resources that are needed to have a more significant impact on the overall marketplace than the vendor could do alone.
 - The most significant examples of strategic partnering involve some of the largest concerns in the computer industry as opposed to small, under-resourced concerns.
 - Two examples of vendors with strategic partnering in the software industry are as follows.
- ### 2. IBM
- IBM, given its size and unparalleled resources, might seem able to fulfill all of its developmental and sales requirements with its own products and staff.

However, the company has been increasingly active in promoting partnerships and license agreements with both large and small companies that can assist with their overall goal of dramatically increasing their share of 1990 worldwide revenue that is derived from software sales.

- In 1984, IBM acquired about a 20% interest in Intel, a major designer of semiconductors. This arrangement has positively impacted IBM's ability to produce microcomputers built on Intel chips as well as use the chips as the foundation in creating operating systems for smaller systems.
- In late 1984, IBM entered an agreement with Interactive Systems Corporation, Santa Monica (CA) to sell a version of UNIX for the IBM PC called PC/IX. In 1985, IBM announced UNIX V for its Sierra mainframes that run as a guest under VM. The product was developed largely by IBM but with some components of Interactive Corporation's IS/3.
- In 1985, IBM and Microsoft announced a joint venture in the area of operating system development. This agreement is of major significance to both users and software developers in the micro software arena.
 - There has been a fear that IBM will take their up to now open architecture operating system (PC-DOS), developed by Microsoft, in house and create a proprietary operating system for future products as with IBM larger systems.
 - This relationship in many ways assures the continuing of open architecture, at least short-term.
- IBM has licensed and is the sole U.S. distributor of CADAM, a discrete manufacturing product developed by a company by the same name in Southern California.

- Another way to increase software revenues is through distributing other vendors' products. In its product center computer retail stores, IBM distributes and sometimes private labels other vendors' popular products as well as its own internally designed packages.

3. AT&T

- Since its deregulation beginning January 1984, AT&T has moved aggressively into the overall information services industry. Initially, their product strategy evolved around the UNIX operating system that was developed by Bell Labs. In 1985, due to market pressure, the company chose to accept the micro-computer industry standard operating system MS-DOS and develop IBM PC-compatible products.
- AT&T, however, has formed some strategic alliances with software vendors, mainly in the UNIX area.
 - In 1984, AT&T and Digital Research entered into an agreement to develop tools and applications software for the UNIX operating system. In 1985, this arrangement was discontinued.
 - AT&T, however, has licensed GEM, the operating environment from DRI that would provide UNIX products with an easy-to-use user interface.
 - AT&T has a large number of VAR agreements for selective vertical market packages that run on AT&T hardware, primarily on UNIX-based systems.
 - Of major significance in 1985 is the joint arrangement between EDS and AT&T in which both vendors are working on providing connectivity solutions in the office environment no matter what brand of hardware or software is being used.

- On balance, strategic partnering will continue to play a major role in the future of the software product marketplace.

APPENDIX A: DEFINITIONS

APPENDIX A: DEFINITIONS

- INFORMATION SERVICES--Computer-related services involving one or more of the following:
 - Processing of computer-based applications using vendor computers (called "processing services").
 - Services that assist users in performing functions on their own computers or vendor computers (called "software products" and/or "professional services").
 - Services that utilize a combination of hardware and software, integrated into a total system (called "turnkey systems").

A. USER EXPENDITURES

- All user expenditures reported are "available" (i.e., noncaptive, as defined below).
- NONCAPTIVE INFORMATION SERVICES USER EXPENDITURES - Expenditures paid for information services provided by a vendor that is not part of the same parent corporation as the user.

- CAPTIVE INFORMATION SERVICES USER EXPENDITURES - Expenditures received from users who are part of the same parent corporation as the vendor.

B. DELIVERY MODES

- PROCESSING SERVICES - This category includes remote computing services, batch services, processing facilities management, and value-added networks (VANs).
 - REMOTE COMPUTING SERVICES (RCS) - Providing computer processing to a user by means of terminal(s) at the user's site(s) connected by a data communications network to the vendor's central computer. There are four submodes of RCS, including:
 - Interactive - Characterized by the interaction of the user with the system for the purpose of problem-solving, data entry, and/or transaction processing. The user is on-line to the program/files. Computer response is usually measured in seconds or fractions of a second.
 - Remote Batch - A service in which the user hands over control of a job to the vendor's computer, which schedules job execution according to priorities and resource requirements. Computer response is usually measured in minutes or hours.
 - Data Base - Characterized by the retrieval and processing of information from a vendor-provided data base. The data base may be owned by the vendor or a third party.

- User Site Hardware Services (USHS) - Offerings provided by RCS vendors that place programmable hardware on the user's site (rather than in the vendor's computer center). USHS offers access to a communications network, access through the network to the RCS vendor's larger computers, and significant software as part of the service.

- BATCH SERVICES - This includes computer processing performed at vendors' sites of user programs and/or data that are physically transported (as opposed to electronically by telecommunications media) to and/or from those sites. Data entry and data output services, such as keypunching and computer output microfilm processing, are also included. Batch services include those expenditures by users who take their data to a vendor site that has a terminal connected to a remote computer for the actual processing.

- PROCESSING FACILITIES MANAGEMENT (PFM) (also referred to as "resource management" or "systems management") - The management of all or a major part of a user's data processing functions under a long-term contract (more than one year). This would include both remote computing and batch services. To qualify as PFM, the contractor must directly plan, control, operate, and own the facility provided to the user, either on-site, through communications lines, or in a mixed mode.

- VALUE-ADDED NETWORKS (VANs) - VANs typically involve common carrier network transmission facilities that are augmented with computerized switching. These networks have become associated with packet-switching technology because the public VANs that have received the most attention (e.g., Telenet and TYMNET) employ packet-switching techniques. However, other added data service features such as store-and-forward message switching, terminal interfacing, error detection and correction, and host computer interfacing are of equal importance.

- Processing services are further differentiated as follows:
- Cross-industry services involve the processing of applications that are targeted to specific user departments (e.g., finance, personnel, sales) but that cut across industry lines. Most general ledger, accounts receivable, payroll, and personnel applications fall into this category. Cross-industry data base services, for which the vendor supplies the data base and controls access to it (although it may be owned by a third party), are included in this category. General-purpose tools such as financial planning systems, linear regression packages, and other statistical routines are also included. However, when the application, tool, or data base is designed for specific industry use, then the service is industry-specific (see below).
 - Industry-specific services provide processing for particular functions or problems unique to an industry or industry group. Specialty applications can be either business or scientific in orientation. Industry-specific data base services, for which the vendor supplies the data base and controls access to it (although it may be owned by a third party), are also included under this category. Examples of industry-specialty applications are seismic data processing, numerically controlled machine tool software development, and demand deposit accounting.
 - Utility services are those for which the vendor provides access to a computer and/or communications network with basic software that enables users to develop and/or process their own systems. These basic tools often include terminal-handling software, sorts, language compilers, data base management systems, information retrieval software, scientific library routines, and other systems software.

- SOFTWARE PRODUCTS - This category includes users' purchases of applications and/or systems software that is sold by vendors as standard products intended for use by different organizations. Included as user expenditures are lease and purchase expenditures as well as fees for work performed by the vendor to implement and maintain the package (when such fees are either bundled as part of the product price or offered on an annual subscription basis). Fees for work related to education, consulting, and/or custom modification of software products are counted as professional services, provided such fees are charged separately from the price of the software product itself. There are several subcategories of software products, including:
 - APPLICATIONS SOFTWARE PRODUCTS - Software that performs a specific function directly related to solving a business or organizational need. Applications software provides information directly for use by the end user. Applications software products classifications are:
 - Cross-Industry Products - Used in multiple user industry sectors. Examples are payroll, inventory control, and financial planning.
 - Industry-Specific Products - Used in a specific industry sector such as banking and finance, transportation, or discrete manufacturing. Examples are demand deposit accounting, airline scheduling, and materials resource planning.
 - SYSTEMS SOFTWARE PRODUCTS - Software that enables the computer/communications system to perform basic functions, which are interim steps to providing the end user with "answers" sought. Systems software product classifications are:
 - Systems Control Products - These products function during applications program execution to manage the computer system

resource. Examples include operating systems, communication monitors, and emulators.

- . Data Center Management Products - These products are used by operations personnel to manage the computer system resources and personnel more effectively. Examples include performance measurement, job accounting, computer operations scheduling, and utilities.
- . Application Development Products - These products are used to prepare applications for execution by assisting in design, programming, testing, and related functions. Examples include languages, sorts, productivity aids, data dictionaries, data base management systems, report writers, and retrieval systems.
- PROFESSIONAL SERVICES - This category is made up of modes in the following categories:
 - SOFTWARE DEVELOPMENT - This service develops a software system on a custom basis. It includes one or more of the following: user requirements, system design, contract, and programming.
 - EDUCATION AND TRAINING SERVICES - These services help people acquire new skills, techniques, or knowledge related to computers. This definition does not include services to educational institutions. (This latter market is included in the education (industry-specific) segment.)
 - CONSULTING SERVICES - Consultants advise clients on computer-related issues that are usually management oriented. Feasibility studies and computer audits are examples of services provided.

- PROFESSIONAL SERVICES FACILITIES MANAGEMENT (PSFM) - This is counterpart to processing facilities management, except that in this case the computers are owned by the client, not the vendor; the vendor provides human resources to operate and manage the client facility.
- TURNKEY SYSTEMS (also known as Integrated Systems) - A turnkey system is an integration of systems and applications software with CPU hardware and peripherals, packaged as a single applications solution. The value added by the vendor is primarily in the software and support. Most CAD/CAM systems and many small business systems are turnkey systems. This does not include specialized hardware systems such as word processors, cash registers, or process control systems, nor does it include Embedded Computer Resources for military applications. Turnkey systems are available either as custom or packaged systems.
 - Hardware vendors that combine software with their own general purpose hardware are not classified by INPUT as turnkey vendors.
 - Turnkey systems revenue is divided into two categories.
 - Industry-specific systems--that is, systems that serve a specific function for a given industry sector such as automobile dealer parts inventory, CAD/CAM systems, or discrete manufacturing control systems.
 - Cross-industry systems--that is, systems that provide a specific function that is applicable to a wide range of industry sectors such as financial planning systems, payroll systems, or personnel management systems.
 - Revenue includes hardware, software, and support functions.

- SYSTEMS INTEGRATION - Services associated with systems design, integration of computing components, installation, and acceptance of computer/communication systems. Systems integration can include one or more of the major information services delivery modes--professional services, turnkey systems, and software products. System components may be furnished by separate vendors (not as an integrated system by one vendor, called the prime contractor); services may be furnished by a vendor or by a not-for-profit organization. Integration services may be provided with related engineering activities, such as SE&I (Systems Engineering and Integration) or SETA (Systems Engineering and Technical Assistance).

C. HARDWARE/HARDWARE SYSTEMS

- HARDWARE - Includes all computer communications equipment that can be separately acquired, with or without installation by the vendor, and not acquired as part of a system.
 - PERIPHERALS - Includes all input, output, communications, and storage devices, other than main memory, that can be locally connected to the main processor and generally cannot be included in other categories, such as terminals.
 - INPUT DEVICES - Includes keyboards, numeric pads, card records, bar-code readers, lightpens and trackballs, tape readers, position and motion sensors, and A-to-D (analog-to-dialog) converters.
 - OUTPUT DEVICES - Includes printers, CRTs, projection television screens, microfilm processors, digital graphics, and plotters.
 - COMMUNICATION DEVICES - Modems, encryption equipment, special interfaces, and error control.

- STORAGE DEVICES - Includes magnetic tape (reel, cartridge, and cassette), floppy and hard disks, solid state (integrated circuits), and bubble and optical memories.
- TERMINALS - There are three types of terminals:
 - USER PROGRAMMABLE (also called "intelligent terminals"):
 - Single-station or standalone.
 - Multistation-shared processor.
 - Teleprinter.
 - Remote batch.
 - USER NONPROGRAMMABLE:
 - Single-station.
 - Multistation-shared processor.
 - Teleprinter.
 - LIMITED FUNCTION - Originally developed for specific needs, such as POS (point of sale), inventory data collection, controlled access, etc.
- HARDWARE SYSTEMS - Includes all processors, from microcomputers to super (scientific) computers. Hardware systems require type- or model-unique operating software to be functional, but the category excludes applications software and peripheral devices, other than main memory and processor or CPUs not provided as part of an integrated (turnkey) system.

- MICROCOMPUTER (or personal computer or PC) - Combines all of the CPU, memory, and peripheral functions of an 8- or 16-bit computer on a chip, in the form of:
 - Integrated circuit package.
 - Plug-in board with more memory and peripheral circuits.
 - Console--including keyboard and interfacing connectors.
 - Personal computer with at least one external storage device directly addressable by CPU.

- MINICOMPUTER - Usually a 12-, 16- or 32-bit computer, which may be provided with limited applications software and support, and may represent a portion of a complete large system.
 - Personal business computer.
 - Small laboratory computer.
 - Nodal computer in a distributed data network, remote data collection network, connected to remote microcomputers.

- MAINFRAME - Typically a 32- or 64-bit computer, with extensive applications software and a number of peripherals in standalone or multiple CPU configurations for business (administrative, personnel, and logistics) applications, also called a General-Purpose Computer.
 - Large computer mainframes are presently centered around storage controllers but likely to become bus-oriented and to consist of multiple processors (CPUs) or parallel processors;

they are intended for structured mathematical and signal processing, and are generally used with general-purpose von-Neumann-type processors for system control.

- Supercomputer mainframes are high-powered processors with numerical processing throughput that is significantly greater than the largest general-purpose computers, with capacities in the 10-50 MFLOPS (million floating point operations per second) range, in two categories:
 - REAL TIME - Generally used for signal processing.
 - NONREAL TIME - For scientific use, with maximum burst-mode (but sustained speed) capacities of up to 100 MFLOPS, in one of three configurations:
 - Parallel processors.
 - Pipeline processors.
 - Vector processors.
- Newer supercomputers--with burst modes approaching 300 MFLOPS, main storage size up to 10 million words, and on-line storage in the one-to-three gigabyte class--are also becoming more common.
- EMBEDDED COMPUTER - Dedicated computer system designed and implemented as an integral part of a weapon or weapon system, or platform, that is critical to a military or intelligence mission, such as command and control, cryptological activities, or intelligence activities. Characterized by MIL SPEC (military specification) appearance and operation, limited but reprogrammable applications software, and permanent or semipermanent interfaces. May vary in capacity from

microcomputers to parallel-processor computer systems. Information services forecasts in this report do not include applications for this type of computer.

D. TELECOMMUNICATIONS

- NETWORKS - Interconnection services between computing resources. Provided on a leased basis by a vendor to move data and/or textual information from one or more locations to one or more locations.
 - COMMON CARRIER NETWORK (CCN) - Provided via conventional voice-grade circuits and through regular switching facilities (dial-up calling) with leased or user-owned modems (to convert digital information to voice-grade tones) for transfer rates between 150 and 1,200 baud.
 - VALUE-ADDED NETWORK (VAN) - (See listing under Section B, Delivery Modes.)
 - LOCAL-AREA NETWORK (LAN) - Restricted limited-access network between computing resources in a relatively small (but not necessarily contiguous) area, such as a building, complex of buildings, or buildings distributed within a metropolitan area. One of the two types:
 - BASEBAND - Voice bandwidth at voice frequencies (same as telephone, teletype system) limited to a single sender at any given moment and limited to speeds of 75 to 1,200 baud, in serial mode.
 - BROADBAND - Employs multiplexing techniques to increase carrier frequency between terminals, to provide:

- Multiple (simultaneous) channels via FDM (Frequency Division Multiplexing).
 - Multiple (time-sequenced) channels via TDM (Time Division Multiplexing).
 - High-speed data transfer rate via parallel mode at rates of up to 96,000 baud (or higher, depending on media).
- TRANSMISSION MEDIA - Varies with the supplier (vendor) and with the distribution of the network and its access mode to the individual computing resource location.
 - MODE - may be either:
 - ANALOG - Typified by the predominantly voice-grade network of AT&T's DDD (Direct Distance Dialing) and by operating telephone company distribution systems.
 - DIGITAL - Where voice, data, and/or text are digitized into a binary stream.
 - MEDIA varies with distance, availability, and connectivity:
 - WIRE - Varies from earlier single-line teletype networks, to two-wire standard telephone (twisted pair) and balanced line, to four-wire full-duplex balanced lines.
 - CARRIER - Multiplexed signals on two-wire and four-wire networks to increase capacity by FDM.

- COAXIAL CABLE - HF (High Frequency) and VHF (Very High Frequency), single frequency, or carrier-based system that requires frequent reamplification (repeaters) to carry the signal any distance.
- MICROWAVE - UHF (Ultra High Frequency) multichannel, point-to-point, repeated radio transmission, also capable of wide frequency channels.
- OPTICAL FIBER - Local signal distribution systems employed in limited areas, using light-transmitting glass fibers, and using TDM for multichannel applications.
- SATELLITES - Synchronous earth-orbiting systems that provide point-to-point, two-way service over significant distances without intermediate amplification (repeaters), but requiring suitable groundstation facilities for up- and down-link operation.
- CELLULAR RADIO - Network of fixed, low-powered two-way radios that are linked by a computer system to track mobile phone/data set units; each radio serves a small area called a cell. The computer switches service connection to the mobile unit from cell to cell as the unit moves among the cells.

E. OTHER CONSIDERATIONS

- When questions arise about the proper place to count certain user expenditures, INPUT addresses them from the user viewpoint. Expenditures are then categorized according to what users perceive they are buying.

- The standard industrial classification (SIC) codes are used to define the economic activity contained in generic sectors such as process manufacturing, insurance, or transportation.
- The specific industries (and their SIC codes) included under these generic industry sectors are detailed in Exhibit A-1.

EXHIBIT A-1

INDUSTRY SECTOR DEFINITIONS

INDUSTRY SECTOR	INDUSTRY SIC	INDUSTRY NAME
Discrete Manufacturing	23	Apparel

APPENDIX B: FORECASTS AND RECONCILIATION

APPENDIX B: FORECASTS AND RECONCILIATION

- The overall market slowdown in 1985 impacted INPUT's 1984 forecasts for software products.
 - In 1984, INPUT projected the 1984-1985 growth rate as 33%. This year we have reassessed the industry and lowered our growth rate for the same time period to 20% (see Exhibits B-1 through B-6).
 - INPUT's five-year growth rate forecast has been revised downward from 31% to 25%. Some of the aforementioned slowdown reasons mentioned in Chapter I still apply, and other long-term market growth impediments are included in Exhibit B-7.
- To be noted is that the overall software product market is still expected to have a significant growth rate--25%--considered exceptionally healthy in most major industries.

CHANGES FROM 1984 SOFTWARE PRODUCTS

REASONS

1. Sheer Size of Market in 1989/1990
2. Acceleration of Drive to Recurring Revenue --
Selling More Leases Than One Time Purchases
3. Implementation Bottleneck
4. Reduced Inflation

B. MARKET ANALYSIS

- The Top 50 Independent Software Product Vendors continue to reflect a dynamic and growing marketplace.
- The data for this year's Top 50 was compiled from an analysis of the Information Services industry that was conducted by INPUT this spring.

- The revenue estimates are for calendar year 1984 and reflect the U.S. software product revenue of the largest independent software products vendors; i.e., vendors that do not sell hardware as their main source of revenue. Software revenues are included in this list even if they do not comprise the majority of a firm's information services revenue. Thus, for example, the majority of McDonnell Douglas' Information Systems Group's U.S. revenue is processing services. However, their total software products revenue is sufficiently large to enable them to be listed in the Top 50. The figures include software maintenance for standard software packages, but do not include development of custom software, education, training, or consulting. Captive sales of software products (that is, sales to internal groups of affiliated companies) are excluded from these listings.
- The Top 50 ranking is based on the performance of vendors in the business environment. This means that like last year, sales of entertainment and education products are not counted. Also excluded are software distributors like Softsel and Micro D.
- To add a further perspective, INPUT estimates that total outside U.S. software products expenditures by businesses was \$10.4 billion in 1984. Of that, over \$3 billion went to hardware vendors for systems and applications software. Additional amounts went to timesharing companies, turnkey systems vendors, and custom software developers.
- The Top 50 are a major factor in this complex market, and they generated nearly 23% or \$2.4 billion of the total 1984 domestic user expenditures. Cullinet ranked first with \$144 million, up from number two last year with \$92 million. Lotus Development Corporation ranked second, with \$140 million, moving up from a number 6 last year at \$53 million. Last year only Management Science America, Inc. (MSA) was over the \$100 million mark. This year, four companies exceeded the century mark (Cullinet, Lotus, MSA, and Microsoft), and as a group they accounted for 33% of the Top 50 total.

- Also increasing was the number of companies between \$50 and \$100 million. This group generated 23% of the total as their number increased from six to seven.
- A number of major trends are shaping the character of today's software products marketplace. They include:
 - Increasing integration of applications and systems software into a single product offering. The most successful products of the last half of the decade will have almost as much value added from systems software components as they will have from their application software parts. For example, the full value of a general ledger system will be as much due to integrated systems software components such as DBMS, micro mainframe links, and fourth generation languages as it will be to the basic accounting functions it performs.
 - Emergence of a true distributed data processing (DDP) environment. This new, more complex universe with its multi-layered processing and remote data base locations is accelerating the obsolescence of older software products. This is bad news for vendors with out-of-date product offerings and/or limited resources, but is good news for vendors prepared to invest in the definition, development, and marketing of new generation DDP-oriented products.
 - The more active and visible presence of IBM in terms of pricing, development, and joint marketing of software products for all sizes of computers.
 - Entry into the software products arena of non-software product information services vendors (e.g., Martin Marietta Data Systems). These firms are expanding beyond their traditional processing, turnkey, and/or professional services focus to include software products as an important aspect of their total offerings. This strengthens their appeal to the specialized markets that these vendors intend to serve.

- Significant acquisition activity. No less than seven of last year's Top 50 vendors are now part of a larger organization.

- All of the factors mentioned above are helping to create a 1985 software products marketplace that is unusually fast changing and increasingly resource intensive. Fortunately, there exists innumerable opportunities provided vendors are willing to be not only innovative but also continuously aggressive in making major investments in quality management, marketing, and technical personnel.
